Picture not there now. So, who all saw and saved it? Surely you have capture software, I do. Supposedly a lot of info was on FCC site too, anyone have the pictures of that? Lets see it.

4. Re: [BCD536HP] SCREENSHOTS ANYONE?

There never was a "picture" of the supposed BCD536HP.
There only was a diagram pic of the back of a radio which may or may not
have been a BCD536HP.
There was never any additional info on the FCC website as it appears that
Uniden managed to keep any additional info private.
When Uniden is ready to announce a new radio UPMan will make sure
folks have accurate info.
Anything else at this time is purely conjecture and speculation.

MODERATOR'S NOTE: There is nothing new on the FCC web site. The only view available is the rear panel view (same since 9/20/2013).

ORIGINAL MESSAGE:

As of yesterday, The FCC has pics of the scanner.

I think the confusion is that you are talking about the BCD436HP in the BCD536HP list. BCD436HP rear view only (nothing that tells you much other than maybe size) appeared this week.

Emmett is correct in that there is currently a rear shot of the 436 on the FCC website (pic of label placement). It's the same pic that was posted on Radioreference.

As for the threats of legal action, IF you have a record, Emmett, and someone states that you do, that is not harassment - that is statement of a fact. Personally, I don't care if you do or not have one, but let's everyone remember to keep the discussion civil and on topic.

For clarification, you're saying it's the pic on the
webpage literally under the one of the label, right?
Like the next link below the label link.

(and not the pic that is placed under (in) the label.pdf link)

I would be glad to keep it civil MCH, but alas, I can't because the idiots from here are the same ones on radio reference who INSIST on kicking me off radio reference, that is why Radio reference is getting sued by me. This is ridulously stupid for them to ban me when I need that site for my scanners to be updated.

I will not be denied radio reference or i will sue to make it MY radio reference. This crap has gone too far by Lindsay and his staff.

NO, what I am saying is BOTH of the new scanner's info is out. the 436 is the handheld and the 536 will be a mobile scanner like the 996xt. Too much info was given out despite UPMAN's wishes.

Upman can't hold the secret anymore, it's as good as confirmed.

I doubt anything was released recently without UPMan's blessing. Yes, there was a leak in July about the BCD536HP model number, but that was all. More recently, I would be willing to bet any release of info was more of a teaser than a leak. Also, some FCC info they will not hold back, and that's why we have a pic of the rear of the 436 and the drawing of the rear of the 536.

There was also a video that has been going around where people got screen shots of the 536 being worked on (at least everyone is assuming it's the 536). But, I doubt UPMan didn't want that leaked as he is the one who MADE the video. Again, it's all about creating buzz, and UPMan knows how to do that well.

Odd that we haven't seen any good frontal pics of the scanners. I'm sure we will after next Saturday.

Oh, and good one, Bob. That, too, was UPMan's creation. Never let it be said his sense of humor is impaired.

If you're talking about the PSR-800/HP-1 scanners, you don't need access
to RR to update your scanners.

As for the suit, that really is not relevant to the BCD536HP.

Again, please keep it civil - no name calling.

I guess I should add the list rules to the main page.

Also, some FCC info they will not hold back, and that's why we have a pic of the rear of the 436 and the drawing of the rear of the 536.

There was also a video that has been going around where people got screen shots of the 536 being worked on (at least everyone is assuming it's the 536). But, I doubt UPMan didn't want that leaked as he is the one who MADE the video. Again, it's all about creating buzz, and UPMan knows how to do that well.

Odd that we haven't seen any good frontal pics of the scanners. I'm sure

we will after next Saturday.

Oh, and good one, Bob. That, too, was UPMan's creation. Never let it be said his sense of humor is impaired.

I guess you misunderstood me. I need radio reference to update my 396XT PLUS i need to communicate with several users on RR.

We are adults here, to ban me for life from a simple scanner/ham site is STUPID, and MCH, I have a right to fuss and holler about this anywhere i choose.

I am a licensed ham and have been since january. For lindsay to do this is beyond idioicy.

The new scanner info was posted on the FCC web site as of november 6th, you people are so dumb as it's been talked about for the last 2 days on radio reference and UPMAN confirmed it.

Next person who references my past is going to have a slew of legal probs, GOT IT??? As that IS harassment.

UPMAN, stop covering things up. I know what's going on. the only thing I am not happy with is that you didn't include any of the features that we wanted. and before you ask, I was told by an informed source that it's nowhere near the psr-800

Emmett: Calm down.

I'm not covering anything up...I'm actually the one who is releasing what legitimate information there is to be had. The pictures that appear on the FCC web site are there because I said that it was OK for them to release them (we could have also made them confidential until the 16th...as are the front views and draft owner's manuals).

I can assure you that your "informed source" does not know what is going on. If they did, they would have told you of at least one major feature that has only barely been mentioned in some speculation. If you can post what that feature is, then I'll believe your source.

Oh, and Emmett, I agree that the post with your prior history was not really relevant to the discussion at hand or to the group. I cannot take the post out of people's in box, but I have removed it from the group archive.

As far as I'm concerned, as long as you refrain from posting incorrect information, or at least accept that sometimes you post incorrect information and not battle back when someone calls out the incorrectness, I have no problem with you being here.

If you have a criticism of a product (or, gasp! a compliment), I'm here precisely to listen to such criticism.

25. List conduct (was screenshots)

Yahoo group: BCD536HP
Date: 2013-11-09 00:00:52 UTC
From: MCH
Topic: 3 Message: 25

The fact you are a ham is irrelevant. That gives no special privileges on this list. (and no special mistreatment either)

Radiorefernce downloads are only for members (they are not public), and if your membership was terminated for whatever reason, I doubt you have any recourse but to use other sources to program your scanner, such as copy-n-paste from the RR website or other local websites.

You do not have the right to "fuss and holler about this anywhere". I will remind you this is a PRIVATE forum, and free speech laws don't apply. I think most people would agree I've given you more leeway to comment than I could/should have, but some things will not be tolerated.

Examples:
"you people are so dumb" (a flame of all list members)

"because the idiots from here" (another flame)

"the only thing I am not happy with is that you didn't include any of the features that we wanted" (with the claim to have inside info)

Well, I recall you saying that Whistler didn't buy GRE's IP rights despite the fact Whistler made a public statement to the contrary. So, are we to believe that you know more about scanner manufacturing than the two leading USA companies making (or with plans to make) scanners? At one time, you also stated that GRE was not out of business - even after the USA project manager and senior SW author told you otherwise. Please don't take this the wrong way, but you seem to have a habit of contradicting the authorities on several topics. And now, you are making claims about the lack of features of the new models before any info is made public. Can you see why your credibility is called into question so often?

Just based on the above three examples, that is enough to warrant a ban. Yet, you are still here. Perhaps you honestly don't see that what you are doing wrong, and you obviously have some deep-rooted hatred toward some list members and Radioreference in particular. But, please don't use THIS forum as a sounding board for your legal case and above all else I will ask you one last time to not flame list members (reference the first two examples). And for the record, this list is not owned in whole or in part by Uniden or Radioreference. BTW, if you do have a legal case, ask your attorney about disclosing details in public. I'm sure he would advise you to not tip your hand about anything - including that there is or may be a case filed.

Another fact for you to ponder: Of all the lists I own, which include nearly all the Uniden DMA model, GRE model, and recent Radio Shack

scanner models, and of the tens of thousands of list members, only two people have been banned in the past 10 years, and the first was nearly 10 years ago. The other has been banned from several lists in the past year, and I'm trying to help him keep from being banned on this one.

Of course, I have little doubt your reaction will be to claim denial of your "rights" and harassment which will only bring you one step closer to that ban. On the other hand, if you treat others with respect, and don't try to buffalo people, maybe you will find you are treated with more respect in turn.

List Owner

Paul, Lindsay is bound and determined to keep me off that site and I feel
that since this is public knowledge, you have no right removing my posts at
all.

I am tired of this crap and Lindsay needs to grow up. I do not intend to go
quietly about this, he pissed me off that bad

Paul, a web site is nothing to call the cops over. Lindsay is being a jerk and half of the people here in this group know what's going on, so why are you censoring me again????? Lindsay banned me for life and i am ENRAGED over it because he refuses to even compromise and even threatened to call the cops.

I am not going to stay off of radio reference and if he doesn't stop, this will look bad for him and everybody who uses that site. I am not being mean but these are facts.

If people want to continue to use my past, then NOTHING will ever be done because the jerks will hound me day in and day out. You can blame Lindsay and his staff for my anger.

However, for the sake of this product unveiling, I'll keep it civil, but lindsay is will not stop me

Hard to believe all this over a scanner. Everyone take a breath. Its just a scanner. I can wait anothwr week because it will probably even be a few years before I can afford to buy another 1.

Howie

Topic: 3 Message: 32

MCH,

NO i cannot program my scanner, the 396xt because the MANUAL way is like greek to me.

secondly, Most of this groups members already know about me hence that flame post TOWARDS ME, so you have no reason to chew me out for conduct.

third, Bans have no reason to be enforced, this is the INTERNET for crying out loud and NOT private property like you claim it is. Don't go on some Power trip like lindsay did on RR against me MCH.

I have every right to vent because people have already called me out today but yet you are singling me out.

I am tired of this crap and as long as lindsay and the ones on this group continue their attitude towards me, then I will not quit, so think twice before you try to single me out for conduct. I know you post on RR too so i know you know what is going on.

If a person like me can't disagree with people on Radio reference to the point a ban is made, then that is going too far. I have stated once before that not everybody knows the truth on that web site. 250 bans in the last 4 months on RR because of the staff not liking what people wrote. This is a fact MCH, not a lie.

Radio reference needs to be shut down permanently.

From: John Stark
Topic: 3 Message: 34

Well I agree that RR has issues HOWEVER that is no reason to shut them down, neither is 250 bans in 4 months when they have as large a user base as they do.
I do however see why people are taking issue with your attitude here. Your problem is with RR not this list. Leave it with RR and drop it here. This list is to help users not fight about RR.
And yes you CAN use cut and paste on RR without having download access to the site. You can use the FreeScan program for one and its pretty simple once you get the hang of it. Just take some time to learn to do it.

You do.

And will it be available in hot pink? Is that why the
case appears to not be shown on the video captures?

On an (un?)related subject, I cannot seem to upload photos
for some reason, but this new neo scheme seems to want to
turn the group pic into some form of new age art, so.... :-\

BTW, there is a pic of the rear of the 436 on the BCD436HP group.
(in the photos section)

I don't think the URL has been announced yet. Time is noon central time next Saturday (one week and about 15 minutes from now).

Forward...

UPman running a test broadcast at 11 am central time on my YouTube channel. Similar to something
you've seen before, but no black boxes over the product.

Link is https://www.youtube.com/watch?v=rb7DugPlTcA , and if it works well, then the instructions
for Saturday will be to watch for the event on the Uniden Upman channel on YouTube.

49. CTCSS vs P25 NAC searches?

Yahoo group: BCD536HP
Date: 2013-11-16 20:51:06 UTC
From: <campd715@...>
Topic: 49 Message: 49

Has the BCD 536HP been designed to search for CTCSS/DCS & P25 NAC tones in one continuous sweep unlike the BCD996XT in which you have to select one or the other in the Tone/Code Search category?

Thanks
Dennis

50. US database installed

From: <vikzimm@...>
Topic: 50 Message: 50

Just watched the video on the 536. They said the whole US database is already programmed into the scanner. Does that actually mean no programming sites in? Just maybe a little fine-tuning with the parameters?

51. Re: [BCD536HP] US database installed

Could. The HomePatrol-1 has the entire database. No user programming unless you want to fine-tune something. Personally, I use all custom programming and very little of the preprogrammed data.

From: Mike
Topic: 50 Message: 53

Y'all can thank me for the new scanners. I finally spent the money for a new BCD396XT this past April and it never, ever fails that when I buy a new scanner, it gets replaced by something better within 6 months to a year. Yep - right on time once again.

I guess if there is a good thing about it this time, is that the new scanners really don't do anything for me that the 396XT doesn't do. I don't have any phase-2 systems anywhere nearby, and the rest of the new features are pretty much fluff for the way I use a scanner. I do like the smaller size of the 396 compared to the new 436HP, too. The 436 and the 536 are great scanners for the price, though.

I wonder now how much effort, if any, will be put into any further firmware updates for the 396XT's.

It was news to me about Whistler taking over GRE scanners. Anyone have a link to more info on that?

Mike

I don't know about you guys but this announcement is a major letdown for me..?

I had saved close to 1000 dollars for these new models but after the announcement yesterday I went out and bought a new Kenwood HF rig instead.?

I am so disappointed. I was expecting something not done in a scanner before like NXDN or Mototrbo (since even hams are using it now and the Chinese radios have DMR).

Sorry Paul but what a letdown... all that hype and still no TRBO or NXDN! Will the next model have all of the above and a fingerprint reader lol.?

No doubt we all had something we would like to have seen.

I would have liked:
A detachable control head that could be connected with a cat5 cable.
DMR would have been nice also.

How is it a ripoff? The choice is yours if it is worth the investment. No one is putting a gun to your head.
 Hey if its not for you fine but how is it a ripoff? Technology changes. To find the changes costs an investment. I think it is great that Paul listens and takes it back to his company. Will I buy 1? Probably not as I want TRBO & NXDN hopefully with time they will add it.

How many companies do you buy thongs from that don't listen to you? He said during the presentation that something else was coming in March. Wait until that announcement and maybe it will be everything you want.

I guess the smart thing is to do the research before you buy. If the PD is encrypted it doesn't matter how cheap or expensive the radio is... It ain't gonna work period. I remember a time where the local rat shack would have all the needed freqs and trunk/non-trunk info so they could sell you a radio that did what you wanted. Today, if you buy mail order, it's the old "buyer beware". Anyone who plunks down $500 or $600 bucks and ends up with a radio that won't do what they want (because of encryption or the radio is incapable and never claimed to be capable), is what is known as an "uninformed shopper". It's best to ask first and a forum like this is perfect for that.

That's the exact opposite of what people have asked for the last three plus years so Uniden listened and came up with a wireless setup.

The app/wireless combo is an interesting way for Uniden to satisfy the request for a remote head. Is it better than the approach used by ham radio manufacturers or the PSR900 (if makes it to production)? I think that depends on the user. For me, the app on a Smart Phone might be too small to use. A low end tablet with maybe a 7 inch screen would work better, I think. Too bad I can't control it with my Garmin GPS screen! :)

There is a lot to like about these scanners. To me the biggest question will be how well it processes P25 audio. If it's not much improved over the XT scanners, then I probably won't buy one.

69. Garmin Control Of Uniden Scanner

Yahoo group: BCD536HP
Date: 2013-11-17 19:32:48 UTC
From: J & D Schnoor
Topic: 50 Message: 69

".....Too bad I can't control it with my Garmin GPS screen!....."

Gary,

How ironic that you mention that. Garmin has some Android based Nuvi GPS units. The Garmin Nuvi 3592LM is an Android based GPS, HOWEVER, it is not currently offered for sale in the United States. What I think would be slick is if they offered a Garmin Nuvi, like the 3592LM, that could be used for:

-Android control of the Uniden BCD536HP, and /NMEA/ 0183 data for GPS scanning

I currently have a somewhat dated Garmin Nuvi 360 and the Argent Data cable that can feed NMEA-0183 data to the Home Patrol. Of course, it is not Android based and would not be able to control a forthcoming Uniden.

Jim

And of course they will probably want another 100 dollars to unlock the features like the home patrol...

I'm going to commercial radios from now on

Topic: 50 Message: 71

Let me start by saying I am generally happy with the new scanners. On the matter of remote head I would prefer a true remote head as an additional option. I can see a problem when I am doing the speed limit (65 mph) and I hear something on the scanner I want to lock in on. With a remote head I don't need to move my eyes from the road, all I do is reach over and use my fingers to locate the hold button. Now using a touch screen is going to make life more dangerous. I will now have to look at the touch screen of a tablet and locate the hold button and watch the screen until I place my finger on the right spot. I drive a large suv so I'm not too concerned with my safety so I will just have to do just this. It is more a danger to the person I hit, but oh well that is the position Uniden has created.

From: Kim Wells
Topic: 50 Message: 72

Again, it is a desire not a complaint.

Wired remote heads have their place in commercial and industrial vehicles.

However,
I am sure Uniden did their homework on how to best satisfy the biggest demand.

My opinion here. The majority of people using a scanner are using it primarily for public safety. There is almost no NXDN or DMR being used in public safety. Personally I wish we could get Motorola to add MotoTRBO to APX portables and mobiles so our cops could talk to the mall and school police, but M insists there is no market for it.

Funny, but we just had a presentation Tuesday about how we could use technology in the FD. It was iPad-based and includes dispatch, visual represntation of who is responding (including their qualifications), GPS-type turn-by-turn directions, hydrant overlays, and more.

I have the Emergency Response Guide (guide for hazardous materials) on my i-devices, too, as well as many utilities for the FD such as friction loss calculators.

It's a wireless world out there, and I think using an existing device rather than requiring the purchase of a custom device is very innovative.

Maybe you could look up the accident statistics for those vehicles that
come with touch-screen devices as OEM equipment. If there is an issue
with them as you say, it should show up in the reports.

I bet you will even be able to have custom add-ons that will
automatically mute the scanner when you are on the phone.
(if you're not using the device as the phone)

I got quotes for a grant for next year, and the portable offerings will be the XTS1500 at $2500 each. The next level up will be the APX series at around $4600 EACH for ONE BAND. But, they will do Phase II while the measly $2500 radio WILL NOT. The XTS2500 will be discontinued by the time the grant would be awarded (which would have been around $3000 for, again, Phase I only).

$500 scanner vs $4600 Motorola. Kinda like putting a Ferrari up against an Aveo and complaining about how poorly the Aveo performs. Duhhhh....

So you can use the "remote head" for other things and likely already
have one and won't have to run wires to the scanner. If it does the same
job, big deal.

?

I got quotes for a grant for next year, and the portable offerings will
be the XTS1500 at $2500 each. The next level up will be the APX series
at around $4600 EACH for ONE BAND. But, they will do Phase II while the
measly $2500 radio WILL NOT. The XTS2500 will be discontinued by the
time the grant would be awarded (which would have been around $3000 for,
again, Phase I only).

$500 scanner vs $4600 Motorola. Kinda like putting a Ferrari up against
an Aveo and complaining about how poorly the Aveo performs. Duhhhh....

Please provide a link to the $500 APX7000. I'm very interested.

I never said apx... but there are lots of xts2500 and xts5000 for $500 and if you need phase 2 there are The new efj radios that do phase 2 for 650-800... ?there is also Harris, Tait and so on.. for trbo the choices are getting larger by the day and for nxdn you can pickup a nx200 for 2-300 dollars...?

From: Viktor Zimmerman
Topic: 50 Message: 83

Wireless I don't mind. Far as I'm concerned, a remote head can be wireless. I don't care! Just want a remote head. I don't think I would purchase this scanner because it doesn't have the remote head option. Just like someone pointed out, it's going to be more dangerous for him without a remote head.

Subject: Re: [BCD536HP] Wish List

Funny, but we just had a presentation Tuesday about how we could use technology in the FD. It was iPad-based and includes dispatch, visual represntation of who is responding (including their qualifications), GPS-type turn-by-turn directions, hydrant overlays, and more.

I have the Emergency Response Guide (guide for hazardous materials) on my i-devices, too, as well as many utilities for the FD such as friction loss calculators.

It's a wireless world out there, and I think using an existing device rather than requiring the purchase of a custom device is very innovative.

So you can use the "remote head" for other things and likely already have one and won't have to run wires to the scanner. If it does the same job, big deal.

You mean the EFJ radios that don't comply with the P25 specs?

(Yes, I know a federal agency who purchased some, only
to find that they could not use the I-Call feature).

Don't mean to be a smart donkey, but
been there - saw that. Got the T-shirt
that says glad I wasn't involved in the sale.

You can buy used digital scanners for less than $200, too.

But, for a new product (comparing apples to apples) you
can't compare a $500 scanner with a $2500-$5000 radio.

86. Re: [BCD536HP] Wish List

Yahoo group: BCD536HP
Date: 2013-11-18 01:25:11 UTC
From: John Stark
Topic: 50 Message: 86

Its no more dangerous than a remote head. Proper mounting and you don't have to look around to find the button, just remember where it is.
People think its harder to tap the screen than turn a button or push one and its not.

Sent from my Verizon Wireless 4G LTE DROID

I have to disagree on using a tablet is no more dangerour than using a remote head. Right now I have 9 uniden, and 3 gre scanners in my vehicle. Mounting 9 heads and using them safely via touch only was no problem. Mounting 9 tablets and using them by touch by sliding my finger around the screen and not looking at the screen I imagine will cause me to do unwanted things as I slide my finger looking for hold, or scan, or pri, etc.

Don't misunderstand me. I am happy with wifi being added. But it would have been nice if the remote head was kept. I don't even care if I needed to buy a remote head that was wifi. And maybe we will see such a head in the future.

Many of the buyers of scanners have a professional use for them. In fact professional users are a big part of the base that started the hobby. I am such a person. I have had just about 2 or more of every scanner Electra (bearcat), regency, sonar, unimetrics, lafayett, fannon, tennalec, gre and Uniden (have I forgotten any?) have made.

We all have different needs. And Uniden has a hard task pleasing the public. I am just adding my 2 cents as to why a remote head would be nice. I am not looking to offend anyone else.

Thanks

If you have room for 9 RHs, odds are you have the justification to mount
9 scanners without the RHs and you will have the buttons you desire.

You have 12 scanners in your vehicle? Your vehicle has got to stand out.

Topic: 92 Message: 92

So aside from the bashing, I got a nice email from a FB friend, old time medic.

Doc

Mark, I've been looking thru some of the posts on the uniden site as well as on RR. You know what? I think Uniden listened big time to what people wanted and I was talking to Manny today (N1SQB) and I told him I can't believe people actually had the nerve to complain about some of the things (not) included in the new versions. I think Paul and Uniden got it right. My intent is to buy one of the new scanners, but I want to wait till this spring or early summer. Not sure which of the 2 I'm going to buy. most likely the hand held but I am definitely buying

Yes, my vehicle does stand out. But the scanners have little to do with it. I operate a "vendor" news truck. I work for both myself chasing news and as a "for hire" news truck for wabc, wnbc, wcbs, wnyw, cnn, fios1 and any other news organization that needs a truck and operator for a day. My many 1/4 wave antennas are hardly noticeable given I have a 1.2 meter ku satellite antenna on the roof.

As for mounting, most of my scanners are mounted in the back of my truck. And the heads are in a custom built console between the seats, And along the front edge of the headliner were it meets the windshield. I use motorola mount 3/4 inch hole mounts. It is basically impossible to route the antenna cables and reach the front seats without putting barrels in and adding jumpers. The remote heads solved this problem. The gre scanners i have used on glass antennas on front windshield. I haven't even mentioned my motorola spectras. They are all trunk mount. And my apx7000 just stays on my belt. My assortment of xts5000's are usually on the floor. And my uhf vselp saber si is clipped to the side of the console.

My vehicle is a chevy suburban.

So bottom line the remote heads work for me. Really the main reason being to keep antenna cables at a decent length. I try to save every db of loss I can. I know our ear can just about hear a 3db loss. But working in the ku band and using waveguide it is in my dna to limit loss.

If there is anyone here that understands the owners manual for this radio. Can you tell me if I am correct in understanding page 37? Does it say that if you have location set to off while scanning favorites list the scanner does not use your location (zip code when entered) to determine if it will scan anything you have in that list and it just acts like a regular scanner (where Location is not important?)

Thanks
Mike Barry

The answer depends on what you mean by "Motorola TDMA".

Any receiver will hear any TDMA format
within the receiver's frequency coverage.

The 536 will, in addition, DECODE Motorola's X2 TDMA format. It
will not decode any other TDMA format, including Motorola's MotoTRBO.

what uniden failed to do is going to be whistler's STAR feature: DMR and
mototrbo is DMR

I also know that Universal studios orlando is NOT fully mototrbo.

And you know this how? (and please don't
give us the "I know a guy..." again).

Then again, wasn't it you who said Whistler didn't
buy GRE's IP even after they made that announcement?

Also, not all MotoTRBO is DMR. Motorola uses
a proprietary trunking format and not the DMR
standard, so only conventional MotoTRBO is DMR.

Not sure where you are getting your info but Whistler is NOT doing anything with DMR with the units they are producing as they are simply the same models that GRE had last produced rebranded. They are not coming out with anything new at all.
No matter what you WISH they would do....

Currently the psr-800 is the first and only Phase 2 Scanner. So guess they will be stocking it/selling it.

Whistler should get up to date on what Uniden is doing though before making statements.

ARCXT won't do the bcd536 (unless Butel comes out with an upgrade BUT the HP is a total different style - pre-programmed).

I would think if ARC comes with something (but don't know) it will be ARC-36HP or something similar.

Topic: 110 Message: 112

The 536 is pre-programmed, too, but the 536 has a lot of features the HP-1 does not, like Quick Keys for Favorite Lists (that neither SW package currently supports), Systems, and Departments/Sites, and Channel Number Tags. There are also the color alerts that are different than the HP-1. Like the scanners, the SW would have to be a pairing of the current XT/HP offerings.

I doubt Arc-XT or ArcPatrol will program the new models.
If anything, there may be a new SW package for the new models.

"Basic" and "Pro" software will be available for these newer scanners.

See ButelSoftware post about it on 12-01-2013.

hello group thank you. i did see the You Tube demo on both the 436 and
the 536.i have never understood the use of the quick keys with my 996xt.
yes uniden has put many new and different features in 436 and 536.

Hi all,

New member to this group. Looked through all the messages, but sorry if I missed it.. Is there a release date for the 536? I see a few companies pre-advertising, but they mention vague release dates for when orders can be fulfilled.

Thanks.

Originally, it was about a month away (late
January), but it might be a little more than that.

Why would it have to stand out? I had almost as many in my 78 Blazer but only two antennas and one was for the CB. All the scanners used one antenna that went to a multicoupler to make it less conspicuous.
And these days its even easier to hide antennas if you have the $$ to do it. You could have a lot of scanners (or radios) and no one would know unless they look right in or hear them.

122. Programming favorites and quick keys

Yahoo group: BCD536HP
Date: 2013-12-27 18:03:44 UTC
From: <mmatteson@...>
Topic: 122 Message: 122

I am new to Uniden scanners. Is there a video or can someone detail how the function of the favorite keys and tag numbers work and are displayed on the scanner screen. In the past with another scanner I had to create multiple scan lists with duplicate talk groups to make it easier to turn on and off the talk groups. I have been playing with the Sentinel software and would like to preprogram the favorites before purchasing the BCD436HP. I know this may be something that cannot be explained in this type of setting in great detail but any help would be great.
Thanks
Mike

If there is a video, it would pretty much have to be done by Paul Opitz.

I don't recall one on that aspect, but I'm in a similar boat as you are.

The GREAT news is that I can finally fit all my TRS in ONE list (FL)!

In the past, I was limited due to memory restrictions and I think scanner architecture limitations, too. With the new scanners, I can program all my TGs in ONE System, including all the UIDs and Sites, and I can assign a DQK to each Police Distrct, each Fire Zone, and each other service (about 60 DQKs in all - previous models were limited to 20, and only 10 of those were easily 'controllable'), PLUS a DQK to each of the 5 "Sites" so I can finally turn on/off any Group (now called Department), and turn on/off each Site as my location dictates.

Hope this helps somewhat. If I can explain further, just ask!

Paul Opitz has begun doing videos on programming the Uniden scanners. He in fact just released the first video in the past couple days. In the first video he stated he would be explaining the Quick Keys in follow up videos so stay tuned as he will most likely post links here.
Paul's videos are not only informative but also entertaining as well! I'd post the link to the first one but can't at the moment. You can find it in the archives however as it was posted to this group as well as others.

There was a post by Paul Opitz on RR that indicates that the release
date he thought was going to be early January, but in fact only the
preliminary shipment (a few units) was going to be coming in then, and
the first distributor batch would be sometime after that (mid January).
He apologized for mis-reading the info on the internal paperwork.

I would rather read multiple responses that help as
opposed to having to use the delete key a couple of times.

I was going to correct you on the 82 port coupler, but you did
so before I could. I would have picked one up for only $300. :-)

Lol, I'd grab an 82 port for $300 as well!
I occasionally use my base unit in the truck. Its a DLI Multicoupler with 16 channels for $295 so for long trips I can run 16 receivers off 1 antenna. The only catch with that unit is you need an AC inverter to run it but I have one as I use it for the laptop in the truck.
The whole setup has made for some interesting conversations on trips :-)

Roger that. I didn't catch the RR post, which is obvious. And I did have the impression it would be later in Jan than earlier. So I guess what I missed was Paul's first estimate for mid Jan.

Thanks for the input,

Bill

Yes I think I would also buy one at that price too. I have problems some days listening to 4-5 radio's at a time little lone 82 at a time. Lol.

Well I appreciate your understanding of my mistakes today.

Paul, or anyone else who's played around with the 436 (Umm.. I'm gonna guess just Paul LOL), how loud is the 436? One of my dissapointments with the 396 was it wasn't very loud.

And BTW if you're ever in need of a Beta tester in the Bay Area California... :)

The last I heard was late Jan to early Feb, as Uniden usually receives shipments around the 20th of the month.

Doubt there are any deals. I have the impression that all pieces in the first shipment to dealers are spoken for (sold). They don't need to offer any incentives as the radios are selling themselves.

If UNIDEN got the radios on the 20th, they then ship to dealers-that's at least another 2 days, and then the dealers fill the orders. So receipt of the radios by the consumers (us) should be around the beginning of Feb. If there are no hold ups. I haven't heard if UNIDEN received on the 20th but that was the expected date. And nothing more in the form of an update has surfaced.

What a terrible marketing plan.. tell everyone about a product, release it to your friends and then take your sweet time to release it to everyone else.

Just talked to Scanner Master. They expect a delivery by Friday of this week and don't know if they will get a complete allotment until they arrive. Once in their possession, they will ship to customers. Also asked if they knew about Scanner World... Their website just has a note about an illness. The gentleman at Scanner Master talked to the owner (or his family) and was told he is very sick. Wish them the best.

Friends? Maybe beta testers... But that's a pre-marketing process, to field test the product before it's marketed.

153. Re: [BCD536HP] BCD536HP in action

Yahoo group: BCD536HP

From: Uniden UPMan
Topic: 142 Message: 153

We have fewer than 100 units aired in so that we can pre-clear a lot of the QC checks. Once these were released by QC (and a week or so before the 100,000 pieces from full production...OK, well, just kidding about that large number) I did opt to fulfill the RRDB Admin orders so that they would be able to gain some familiarity with the product prior to the flood. I thought that this would actually be a great marketing plan, as these folks are considered "opinion leaders" in the category, and are not affiliated with Uniden so are able to provide unbiased assessments of the scanners very early on. Based solely on wise871's posts, I feel the plan succeeded.

My alternative was to sit on the few units I had on hand until the main shipment arrived. It isn't like I had thousands of units here and just sent a few out to my "friends" (of the hundred or so RRDB admins, I personally know only 2 or 3, and have no idea whether any of them took advantage of the admin offer).

Oh.

I'm not surprised. If you honestly think that Uniden is the first company to do this or that no other company does that... I've got some shocking news for you.

I've done beta testing of hardware for a dozen or so companies. I often see new devices months before they're even announced. And often these devices don't make it to market. Aside from Beta testers, I'm sure most copmanies have 'friends' they pre-release items to.

On Wed, Jan 22, 2014 at 12:23 PM, Racoon Rowboat <racoonrowboat@yahoo.ca mailto:racoonrowboat@yahoo.ca> wrote:
[QUOTE=UPMan;2105860]We extended a direct offer to RR db admins. We got a few units early (pre clearing for QC) and I was able to grab those to fulfill the admin orders.

"Regular" (if there is such a thing) purchasers should be seeing them available next week some time from dealers.

The scanners were made available to some of the database administrators from RadioReference. The logic was two-fold; as a small token of the appreciation for all of the work they do on their own time/dime and to give them the opportunity to put the radios through their paces before they were released to the general public, thereby giving us, the consumers, a knowledge base from real hands on experience.

As others have posted, the internal speaker is on the bottom of the unit.

Unfortunately, the BCD536HP does not have "feet" like the BC780XLT had,
so you may need to prop it up on something in order to keep the internal
speaker from firing directly into your desktop or shelf thus muffling
the sound. The mobile mounting bracket can be pressed into service for this.

182. EXT. Speaker Warning

Yahoo group: BCD536HP
Date: 2014-01-25 16:08:35 UTC
From: <w8zt@...>
Topic: 182 Message: 182

BCD536HP Only - All audio output is Class-D amplified (PWM). Never connect Ext. SP jack or headphone jack to an external Class-D AMP.

Can anyone accurately expound on this ? Not quite sure why. From the use of the word "jack" I take this to mean modding the unit physically. Do you think they meant to say "plug"? and if so why ?

183. Speaker Warning

Yahoo group: BCD536HP

I too wonder why it takes so long... Possibly It may depend on what you subscribed to... Daily posts, individual posts, etc. Assuming you have it set to individual posts, check to see if there is a delay setting with you provider' server. And my iphone has options as to how long it waits before it checks for new mail, probably to save battery strength. But those delays are measured in minutes, not days.

I believe Uniden specs a stereo plug.

If you have a mono plug, use a mono to stereo adapter.

What were they thinking? Likely that most people will mount the unit below the dash in which case the optimal placement would be exactly where it is. Second, that any base use would use either the mount as a stand or would use the supplied feet which allow the speaker to be free of obstructions.

Those using DIN mounting would most likely use external speakers which would only be not required if the unit had a front-facing speaker which would require eliminating the display or the keypad which are much more important.

Yeah it's hard to believe they would release a scanner with one of the main selling points no where to be found. I ordered this scanner purely for that feature so I am a bit annoyed. In my case I have a 40 foot tower that comes in to my shack, I wanted to put the scanner down there using the main antenna and use my samsung galaxy as the remote head.. ?to this day if you go to the uniden website it is one of the key selling feature... but if your paying attention to the fine print they have at the bottom in tiny letters "siren app available q1 2014"... q1 is pretty vague...

http://www.uniden.com/scanners/icat/scanners_b2c

What is even more disappointing is reading all the clones at radio reference that are afraid to criticize how poorly the app release has been executed.. ?as if not to lose some special favor they have found with Upman. ?

Disappointed.. ?but still entitled to my opinion.?

So my 536 shows tomorrow. But so far, no app for WiFi. Upman estimated sometimes around the beginning of January. It's now January 26. But Upman replied to this question with "Not yet" about a week ago. Sure, it's coming, but when?

Q1 runs from January to March - maybe a little later depending on their quarter start. Seems they have over two months to release that feature on-time. This is in line with what Uniden has been saying since the original product announcement in November.

Since this predates pre-sales orders, I would say you weren't paying attention or were misled by dealers.

As for criticizing the timing, maybe they read the pre-release threads which, like the website, clearly says the SIREN app would not be available at product release.

I figure the acoustical engineers were utilizing the shelf or table top we place the radio on to give the speaker some directional angle whereby the sound is projected out at the user. That, and the enclosure is better protected against accidental liquid spills.

I agree it is posted on the uniden site right after the blurb about the radio.. no one ever disputed that, but a lot of the hype was about the remote head ability.. I would still have bought the radio... I just might not have rushed out and pre-ordered it if I had of realized that the app wouldn't be out right away... cause your left with a amazing gordious scanner that is not using its full ability... its a tease lol.?

The reality is I buy every uniden scanner that is released no matter what the ability... I am a true uniden fan... never got in to radio shack as much... perhaps that is why I am so disappointed that I don't have the app in my greedy little hands.?

Anyhow nobody is dumping on Paul as he probably has no control, rather just stating my opinion and disappointment at the slow release of siren.?

In the mean time, you can enjoy the scanner locally while the app is developed. Hopefully your OS will be the first one released.

> What were they thinking? Likely that most people will mount the unit below the dash in which case the optimal placement would be exactly where it is. Second, that any base use would use either the mount as a stand or would use the supplied feet which allow the speaker to be free of obstructions.
>
> Those using DIN mounting would most likely use external speakers which would only be not required if the unit had a front-facing speaker which would require eliminating the display or the keypad which are much more important.

Given the way most car interiors are shaped these days, designing any aftermarket radio for under dash mounting is kinda silly.

In the old days, when cars had wide, flat dashboards that ran the width of the car, under dash mounting made sense. Since many cars now have center consoles, there's no under dash area in the center of the car. Mounting under the dash in either foot well is a problem because the manufacturers are required to build knee bolsters in that area to keep you from submarining out of the seat belts in a crash. Mounting a radio there is going to result in the driver or passenger banging their knees into the radio.

Vehicle mounting is simply a problem in modern cars and it takes some careful planning to find a spot where the radio is visible to the operator without being a hazard in a crash.

Some ham radio gear, notably the Kenwood TM-V71, allows for the display to be rotated 180 degrees on the main unit of the radio so the speaker can be positioned for either bottom- or top-firing.

That said, Uniden does supply the typical mounting bracket for the BCD536HP. They also supply square rubber feet and there are indentations in the mounting bracket for those feet. So, it's fairly easy to apply the feet to the bracket and then attach the bracket to the radio. That will get the radio up off the desk or table a bit so the bottom-firing speaker isn't muffled.

Bob...

Yeah I get that now.. but being someone who don't read all the forums I was under the impression that it would arrive at my door with the unit... anyhow UPMAN said that he will release a beta to the eager people this week so that makes up for it. ?Speaking from a customer-consumer point of view if I was to buy say a new XM satellite radio and get it home and all setup only to find out that the satellite wasn't launching for a month or two and all I could get is FM I might be a little put off... that's all I was saying about the app release. It seems like sometimes hobby items get a free pass on stuff like this because a large base of the users followed it from the news release of its development to the shelf... anyhow it's just my opinion on the matter, opinions are like aholes everyone has one.?

Legitimate complaints, yes. My reply was pretty factual. Uniden has been saying for months the SIREN app would not be available at release. Your comments sound like sour grapes.

Extrapolating your reply, it sounds mike your preference would have been to not release the scanner until an app maybe 10% will use is ready. How is that best for the customers?

I don't have any phase II systems within 200 miles of me. Should I be upset that I can't use that part of the scanner yet? Fact is most users won't use the app, and those users are enjoying their scanners to the fullest right now.

Maybe you should be angry with the app developers. I think I've heard there will be more apps than just Uniden's.

Kinda reminds me of not having SW support the first week previous models came out. For accessories sometimes you have to wait for them to catch up. Your XM example is more like the unit being operational now, but the install kit for your new model car not being available yet so you complain that you can use it in your 2014 release car yet.

On other thought. You get a few days to figure things out and when you are totally confused your new app arrives. Good luck.
Will be driving all over town for the UPS man tomorrow. Already told my daughter if that means she is stuck at school dismissal then that's the breaks lol. So now the wife has 2 things to kill me over.

I don't know. Part of it will surely be a remote head design, as its a replacement for the RH96.

More than likely what it means is that the audio has DC potential, so it needs to remain isolated from any other grounding or B+ source.

The use of a small audio transformer would provide isolation and allow the connection of an external amplifier.

My guess is, it'll be here when it gets here.. Likely they have found an undocumented feature (bug) or two and they are working those out before they make it available. Otherwise everyone will be complaining about that.

Mine, is scheduled to show up tomorrow as well. If it take a few more weeks to get the app ready, no big deal.

As I said before I don't follow all the threads on radio reference and from what I saw on the initial video and buzz I heard I was expecting to open the box and have a complete package.?

Even the wiki Paul has up says the first thing to do is update the firmware on the scanner and on the wifi dongle... so of course the first thing you do is update the firmware on the scanner and the dongle.. then you find out that the siren app isn't even out yet.. that is where confusion sets in for the un-educated buyer. As for figuring out Q1 release... even that can be confused as vague because the scanner was to come out in Q12014.. so one might assume that both would come out together, I know now that is not the case.

As for you saying siren will likely only be used by 10% of users I think your way wrong on that.. I for one don't believe Uniden would put all that money in to development if they believed only 10% would use the feature. I am going out on a limb and guessing that it will be one of the top selling features of the 536...

Anyhow nothing really matters anymore as Paul said on radio reference that something will be released in the next couple of weeks.. beta or final... who knows.

Restating my question and then adding your best guesses as to what might have happened to cause a delay, all in an attempt to pacify those with the same question only sidesteps the original question of when will the app be available? You did not answer the question. And it was posted in the hopes of someone who could, like Upman, for example. There was only one definitive response and that was from the fellow who saw a post on RR from Paul telling us there could be something of a beta mid-week. As I haven't time to check Yahoo Groups plus Uniden plus RR Forums on a regular basis, I missed the Upman posting and thank the fellow who forwarded this "ANSWER". (Caps are to emphasize our posts should try to stay on point when responding. I don't post unless I have the answer or something that helps work towards getting it.) mostly, your response was not well received.

SIREN will be more useful than the RH96, but even that had maybe a 5% user rate.

I don't want to really tick you off or pop a gasket, but the analysis is another feature not released with the initial product release.

I think the top feature will be the P25 phase II, as this is the only currently available scanner with it and the only mobile there has been.

Answer: when Uniden feels it's ready and has passed their QC. For those looking for a specific date, don't hold your breath. I'm sure it will be available ASAP.

From: Larry Koch
Topic: 176 Message: 222

I don't think you would want to "prop it up" on something. The mobile bracket that you mentioned is designed to be used to sit the unit on a flat surface. It comes complete with rubber feet.

> speaker? If it is internal, is it on the bottom of the unit.

As others have posted, the internal speaker is on the bottom of the unit.

Unfortunately, the BCD536HP does not have "feet" like the BC780XLT had,

so you may need to prop it up on something in order to keep the internal

speaker from firing directly into your desktop or shelf thus muffling

the sound. The mobile mounting bracket can be pressed into service for this.

223. Help file / document for Sentinal software

Yahoo group: BCD536HP
Date: 2014-01-27 04:44:44 UTC
From: Evan Platt
Topic: 223 Message: 223

So I plan to get the 436 this week assuming it comes out....
I downloaded the Sentinal software - that's the programming software, right?

I can't for the life of me figure out how to edit anything on there?
Am I missing something obvious?

Also not sure where the data is being retrieved from, but it's quite old.
For example, Alameda county CA shows on an 800 Type IIi system. They've
been on 700 p25 for a few months now.

Make sure you are DLing the x36 Sentinel and not the HP Sentinel.

You can only edit Favorites Lists, not the database data. Copy some dB data to a FL first.

The data comes from RadioReference.

I guess next time the release of the radio can be delayed unitl the siren app or whatever they have in store is ready. I suspect that will cause complaints too. Personally I'd rather have the radio in my hands to play with while I wait for the app. Fortunately I do and love it despite some quirks such as the layout of controls on the radio. I can hear things on 800 that I couldn't before. It opens up a new region of the metroplex for me to listen to that I couldn't before and generally speaking I am pleased with performance on P25 simulcasts that I listen to.

From: Uniden UPMan
Topic: 190 Message: 228

Since there seems to be some misinterpretation of what I said on RadioReference last week, here is my original post from there:

And, yes, I am very disappointed that we are still working on the app. Actually is requiring firmware updates to accomplish what we wanted...which we got for testing/development a couple of weeks ago. I don't have an ETA, yet.

Normally, we do closed alpha- and beta-testing. I will likely keep alpha-testing private, but do open beta-testing so those of you with the scanner, already, will have something to play with if you are so inclined.

Not from the original post, but relevant from the followups: You don't need to email me asking to be included in the beta. "Open Beta" means that it will be open for anyone who wants to try.

Also, the first platform to be supported will be iPhone (sucks for me, too, as I have all Androids). I expect to see the pre-alpha this week, so having a beta this week is out of the question.

Ok, thanks. Messing with it now.

Oh man, Paul, are you there? Can I make a few suggestions on the software?
LOL :)
first suggestion is the "Add to favorites" is somewhat annoying. I don't
see a way to add a few at a time. And when you add, it takes you to the
favorites. So if you want to add say 10 systems, you have to add 1, then
scroll back up, then add, then scroll back up, etc - or am I missing
something :)

Also, the first platform to be supported will be iPhone (sucks for me, too, as I have all Androids). I expect to see the pre-alpha this week, so having a beta this week is out of the question.

Restating my question and then adding your best guesses as to what might have happened to cause a delay, all in an attempt to pacify those with the same question only sidesteps the original question of when will the app be available? You did not answer the question. And it was posted in the hopes of someone who could, like Upman, for example. There was only one definitive response and that was from the fellow who saw a post on RR from Paul telling us there could be something of a beta mid-week. As I haven't time to check Yahoo Groups plus Uniden plus RR Forums on a regular basis, I missed the Upman posting and thank the fellow who forwarded this "ANSWER". (Caps are to emphasize our posts should try to stay on point when responding. I don't post unless I have the answer or something that helps work towards getting it.) mostly, your response was not well received.

I've heard the term "jack" used to describe both the plug and socket. "Jacking in" a speaker merely meant to plug an external speaker. As for what you see as a warning about amplifiers, class D or otherwise I take to understand as being instructed to never feed any level of voltage into an external speaker or earphone jack (port). Uniden makes an amplified speaker that has a stereo plug for scanners and I use one on the HomePatrol-1, a mobile setup on a full dresser motorcycle-you can imagine the need for an amplified speaker in that environment! Using Uniden's amplified speaker will save the need for a mono to stereo adapter and be completely compatible with the X36HP's. One of the two BCD536HP's I have is replacing the HP-1 on the bike and will use the amplified speaker and be remotely setup in the travel pack with the WiFi connection to my Iphone.

As long as the device supports the version of iOS that is required then it should work. For example, my first generation iPod Touch can't run iOS 7, but your iPod Touch may be newer and support iOS 7. Therefore, if the Siren app requires iOS 7 it would run on your iPod Touch but not mine. We'll have to wait and see what the requirements are.

From: SmokChsr
Topic: 190 Message: 237

It's Arrived!! I'm so excited..

Well out of the box, it wouldn't receive (decode) my local P25 system. (I'm sure it will, just something flaky in the database) Working with the Sentinel software to program the local system in a manner that will work now. The Sentinel software is quite "clunky" but I'll get through it.

Loaded my favorites list don't seem to be able to get it into the active scan list. Humm guess I'll have to read the book..

Eeks.. quick keys don't work like a 996 humm guess I'll have to read the book.

Tried to let it onto my network via Wifi.. infrastructure mode get a Connection error.. with no friendly recovery.

UPMan-- IF you're reworking the firmware for the wifi, you might want to add a bit more information for the infrastructure mode, such as what system it's trying to connect to. And a bit more info as to why it wouldn't connect. I'm fairly isolated and entered my network key and it failed several times. Still I don't know if it found my network or another.

I know you'll be tweaking on this one for a while..

As I will be reading the manual trying to learn this critter as well.

Got mine also... First thing I did was update the firmware and database. Haven't timed how long it takes to update the micro chip's RR data while in the radio compared to removing it and writing to it directly from the computer. But it didn't take long. The GRE PSR-800 would exhibit a noticeable difference, taking much longer to load the chip through the radio. All functions are nominal with the exception of the WiFi dongle-just awaiting the app release. Gonna put a Juice pack on my iphone in the interium.

239. GPS

Yahoo group: BCD536HP
Date: 2014-01-28 15:59:40 UTC
From: N1CHU
Topic: 239 Message: 239

Question... With a GPS receiver connected to the BCD536HP in my car, can I set the scanner to acquire new systems as I approach them and avoid them as I distance myself from them using the entire nationwide database? I will be driving the I-95 corridor from Ct to Fl. And using the nationwide database with the GPS receiver should do it? I would be turning off most types of services such as aviation, and limit my selections to public safety for the trip. I am aware of all the probable data channels I could encounter which will lock the scanner down but hope I don't have to continually manually avoid (lockout) channel after channel, which would get old real quick. I'm banking on the systems being up to date.

Has anyone done this with the HomePatrol-1? Or has anyone got or know where there are frequency databases for this trip?

Thanks in advance,

Bill

Bill,
I have the HP-1 with the GPS set up in my car & it works just Excellent. Just make sure to have your built in database updated via radio reference
before you leave. Also its best to have an outside antenna of some sort connected to your scanner. I use one of those 19” black magnetic scanner
antenna’s on the roof of my vehicle & it works great. I have used it on a trip from WI to FL & also a trip to Dayton OH & it was great fun. I had the
most problem when monitoring the business service as that would make for a lot of data channels to lock out. Wasn’t too bad on public service. I
also listen to the Ham bands at times as I am a “ham” & it was interesting to see what channels it would find going down the road. I also found that
the included whip that comes with the HP-1 isn’t very effective. So when I get to my condo room in FL I would just take my magnetic antenna off the
roof of my vehicle & put it on top of the refrig in my room & that worked Super for picking up all the local stuff. Also when using the GPS when you get
to your destination it remembers where you were last so if you bring your scanner into your room you don’t have to enter the local zip code. It will just
remember your location. Have a good Trip & have fun with your scanner. I’m heading for FL (Panama City Beach) in Feb. myself for a couple of weeks.
Got to get away from this Awful winter were having here in the Midwest. P.S. I have a BCD-536 coming this week yet & will play with it on my trip.

"he is credited with innovations such as creating the Dynamic Memory Architecture used in Uniden's professional-series scanners since 2005, and making GPS-control of scanners a reality."

For all of those who have helped me along the way on this group and previous scanner model groups, the following...

The above was gleaned from Paul's "Read First" page which I happened to glance at AFTER I read Paul's response to my GPS question. It was the speed in which this answer made it back to me that made me a bit curious and sought out that page. I figured Paul is well versed on all aspects of the product and fielding questions is something he is happy to do, but more-so when it relates to a particular aspect of the product he was directly responsible for. And I'm guessing he had no problem posting his reply without hesitation when he read my GPS question. Reading between the lines has helped identify this man as one who takes pride in his work, as well he should. The products of late have been revolutionary in many aspects. To me its the biggest thing to hit the scanning community since the introduction of Radio Shack's 2005 (I'm botching up the model here but it was just before PL's were introduced as part of the scanner and the receiver on this desktop radio was hot.) If I'm not mistaken the radio was made for Radio Shack by GRE.

Thanks for the quick reply Paul. The Upman persona has really done the trick for me as my order for 2 536's and 1 436 indicates. Just waiting on Butel's programming and the Siren app to complete my customization of the 536's I got yesterday.

Bill

Plug your cable into the front USB mini-B jack. The rear "A" jack is for
the WiFi dongle.

Thank you. Been wiping lots of egg off my face on this one. i just wish the manual was a little more specific about the controls and hookups, similar to my ham radio manuals. Got it updated and all is well. Still waiting to hear what amplified speakers will or will not work with the 536. Don't know much about class d amps and have heard lots of guesses and even was told not to use an amplified speaker and then they provided a link and said to use this one. It turned out to be a standard Bearcat speaker that was modified with an amp. Right now the stock speaker is great while in the house.

If you are going to use an amplified speaker (braodcasting to an acre or two?), drive it from the earphone jack (front output). If you just want a 'better' external speaker, my preference is the Uniden or Motorola 4" speaker run to the ext speaker jack (rear output)

> Still waiting to hear what amplified speakers will or will not work with the
> 536. Don't know much about class d amps and have heard lots of guesses

A class D amplifier is one that uses a switching output, typically using a MOSFET transistor that can be (and likely is in this case due to the caution) directly coupled without isolation to the output.

Said another way, (which hopefully will make more sense) The Audio output can have a DC component to it that could cause damage inside the scanner should it come in contact with a different DC potential from an amplifier.

The easy way to solve the problem is to provide DC isolation between the scanner and the amp. Most amps will be built with DC isolation for the input, but some do not, and you won't know which is which until the magic smoke drifts out.

So to be safe, you can DC isolate the scanner with any of the following a audio transformer, series capacitor, or even a series 100 ohm resistor, which will provide the scanner with enough isolation that it won't be hurt. A audio transformer with a 10-50 ohm resistor across the input is probably the best option.

258. BCD536HD HELP

Yahoo group: BCD536HP
Date: 2014-01-30 14:56:32 UTC
From: <wb3anq@...>
Topic: 258 Message: 258

I have just received my BCD536HP! Thats the good news!
When I powered it up I was greeted with the following message:

City data read error
Please check
City Table VI.00.00 dat
InSD Card

The scanner then says USB Mass Storage and won't go any further.
I have tried to clear the user data, formatted the SD card as described on page 80 of the used manual
but nothing seems to work

Does anyone have any ideas how to correct this problem?

Thanks
Larry Putman WB3ANQ

I received my bcd536hp on Tues 1/28/14. Out of the box everything is working great. This is an awesome scanner. Does anyone know when the Siren App will be available? My wireless setup is ready & waiting to use the app.

Still writing the script. High load due to product release causing major slowdown in writing.

I received my 536 yesterday. How much trouble is it to set up the WiFi dongle?

Easy as pie

All you need to know is the name of your SSID, the type of encryption (WEP? WPA?) and the passphrase

ML

265. Antenna placement

Yahoo group: BCD536HP
Date: 2014-01-30 17:38:51 UTC
From: <genelp@...>
Topic: 265 Message: 265

I have two high quality ham antennas mounted on my sedan trunk with Diamond high quality trunklip mounts. Both antennas are wide band Comet CA 2X4SR's. They are approx. 2 feet apart from each other. I have been using one with my mobile 2m/440 at 50 watts. The antennas, I think, also have some gain. My question is: if I have my new 536 scanner connected to the other antenna, is there a danger damaging the front-end of the scanner if I happened to transmit with my transciever as I am scanning with the scanner using high power and antennas being so close to each other? Thanks for a response. 73 W1GLP, Gene

At 2 feet? That's way too close.

267. System Control and Sentinel Software

Yahoo group: BCD536HP
Date: 2014-01-30 18:23:41 UTC
From: Patrick
Topic: 267 Message: 267

1. Turning a system on and off on my 396 was as easy as pressing the corresponding quick key on the number pad. That does not seem to work on the 536. Is there an easy way?

2. Is there a manual for the Sentinel Software? How do we obtain updates versions of the software?

Thanks

Pat

It's the same with the 536 but you have to add the FQK first.

Before, you hit SQK. Now, you hit FQK.SQK then enter

Gene,

I wonder what was on the second antenna before the new scanner... And why an amateur radio operator would be forgetting what overloading can do. At very least, the receiver of the scanner (or whatever radio is subjected to this close proxcimjty of a transmitter) would be subjected to a very high noise floor which will be higher than any other signals, drowning them out. At worst, ...well I wouldn't want to find out. The fix is easy however... Get some distance between the two antennas or if you leave them where they are, don't transmit while the scanner is on. Optimum location for an antenna on a vehicle would be at the center of the metal mass, smack dab in the middle of the roof. Use the other one for the scanner as far away on the vehicle as practical.

About 5 feet which is much better.

If you really want to 'do it right', add a cutoff relay to the scanner so when you TX you disconnect the scanner.

Another advantage old be to not use the same model antenna which induces the greatest voltage into the scanner's front end.

It's simply a coaxial relay that has the normally closed side in line with the scanner. Wire it with your PTT line so when you transmit it energizes the relay and interrupts the scanner antenna line. If you want to go cheap you can get one from a 70s mobile radio.

Well I googled some of my usual sources, and couldn't find anything for antenna cutoff relay, so wonder if it's called something else? Or where I can get one?

I hope it's not too expensive! :)

Topic: 267 Message: 275

Joe:

I guess my mind is clogged....

On the main screen I show

FO: 1
SO: 123

I press 1 on the keypad and the QK Navigation Screen appears with 1 in the first line. I can then turn on / off FL 1. It will not let me turn indiv systems on or off.

Thanks

Pat

Based on what you posted, try:

1.1 enter
1.2 enter
Or
1.3 enter

That did it. Thanks

Is there a manual out there for sentinel?

Pat

Are you using DHCP or Fixed IPs? You must use DHCP.

Menu
scroll to Wi-fi set up press E
Scroll to Set Connection press E
Select Infrastructure mode press E
Select AP highlight the one you want press E
Enter the passphrase -- note you need to scroll the numbers or letters and use the keypad 4 to move left or 6 to move right
once entered press E

This scanner in my opinion, is far more complicated to operate than the Home Patrol-1. Where in the manual does it tell you how to save to favorites? I can't seem to locate this process in the manual anywhere. Any help would be appreciated.

Dean

289. Single Frequency Quick List

Yahoo group: BCD536HP
Date: 2014-01-31 03:31:20 UTC
From: Patrick
Topic: 289 Message: 289

I would like to create a quick list containing a single frequency. I built one and placed the frequency in a new department under the QL. However, when I download it to the scanner and select it, I am told "nothing to scan."

Thanks

Pat

Are you sure it was selected for DL to the scanner?

Did you select the FL for scanning?

Did you enable all the QKs? (FQK and FQK.SQK and FQK.SQK.DQK)

291. Side by Side Test with GRE PSR 800

Yahoo group: BCD536HP
Date: 2014-02-01 09:40:41 UTC
From: <bob.torio@...>
Topic: 291 Message: 291

Just got my BCD536HD and trying to absorb the all information in the manual. Great scanner so far, but I noticed in comparing it to my GRE 800, the GRE is more sensitive than the 536 while scanning the Oakland PD (CA) P25 system. I'm close to a repeater, so this doesn't seem right. Is there some settings for P25 systems I haven't come across yet ? P25 adjustment modes are mentioned in the manual, but I can't find them in the menu. Thanks for your help.

294. Discriminator Tap

Yahoo group: BCD536HP
Date: 2014-02-01 16:26:45 UTC
From: <rich.n9jig@...>
Topic: 294 Message: 294

As in prior Uniden radios the Discriminator Tap point is on the top of the main board, labeled as such. I wrote this up on RR at:

http://forums.radioreference.com/uniden-scanners/283316-bcd536hp-discriminator-inside-look.html#post2120270

There are also some interior pictures in the post of the protected area and board layouts.

Enjoy!

Reading some of those who are having issues are causing them themselves.
1: using ATTEN when they shouldn't, others not using it when they should
2: one missing the first part of conversations has PRI on and everyone seems to ignore that tidbit and come up with a 100 other excuses.
3: blaming the scanner and not the techs who didn't set up the system on spec.

Soooo....

My question is, how are you determining that the GRE is "more sensitive"?

Are you referring to the signal display or other reception anomalies.

So far the RF sensitivity of my 536 seems to be excellent, but it is
still having some issues with P-25 simulcast. (but is an improvement).

If this is a P-25 simulcast system, that can be a different can of worms
than a sensitivity problem, even though it may appear as one.

The system I monitor swapped control channels yesterday, left me in the
silence for a bit until I realized what was going on and programed to
correct.

By sensitivity, I mean comparing the audio transmissions of both. The 536 would miss (not play) the first part of a transmission at times (half second to sometimes afew seconds), where as the 800 would transmit the entire transmission. Should have known better than to buy the first generation. The system is a simulcast system, which the GRE apparently does not have an issue with.

That could very easily be a difference in settings. Specifically the P25 wait time.

I know this thread is about the 536, but with the 436, listening to Alameda County's 700 mhz system, with a 'stubby' antenna (a generic version of the comet sma-209
https://www.theantennafarm.com/catalog/comet-sma-209j-5592.html) , I can pick up the system just fine anywhere in the house. On the 396, I'd have to get the radio positioned just right to pick anything up - same exact antenna.

Hopefully it will be that simple. I've been trying to experiment with the P25 settings, but I can't seem to get them to stick with the software.

My situation is just reverse. My new BCD536HP now receives great audio on a simulcast system in my area that neither my GRE-800 and PRO-197 never even heard.
I'm using the same discone antenna 20' up on my ham radio tower.

All my radios do OK with the P25 simulcast system here but the 436 and 536 are better than the others including a borrowed 800. Even the 396t is better sounding than the garbled 800 here. All the radios are on the exact same antenna using the same type and length of coax between the scanner and the multicoupler.

The poster missing part of the transmission, make sure all priorities and CC are off! The only time I have seen that issue is with users who have one of those items on!

310. Alert LED

Yahoo group: BCD536HP
Date: 2014-02-02 08:56:03 UTC
From: <hbmarcott@...>
Topic: 310 Message: 310

I have tried to locate info in the manual on how to make the Alert LED stay on during the entire reception of a channel. It only stays on for 3 to 4 flashes and the shuts off. If I am occupied with other things across the room during reception I like to use the Alert LED to tell me what I am listening to, but by the time I look at the radio it has stopped flashing. I also have a BCD396XT and a BCD996XT and the flashing screen color has the same problem. I have 2 GRE manufactured scanners that allow their Alert LED stays on during the entire transmission. Also it would be nice if you also could have multicolor Alert LED such as alternating Red and Blue. This would give a larger selection of Alert Colors and steady on or flash combinations.

All of this should be possible through firmware updates.

314. 536 not saving date / time?

Yahoo group: BCD536HP
Date: 2014-02-02 20:48:47 UTC
From: Evan Platt
Topic: 314 Message: 314

So I can't find it in the manual, but I know I read something like keep the 536 plugged in for at least 50 hours to charge the internal battery, and the battery should last a week.

So plugged in the 536 yesterday around noon. Left it on for an hour. turned off radio - non switched outlet, outlet is always on.

Turned radio back on today (just now) and get the error set date / time.

Shouldn't the battery charge while the radio is off? I guess I can leave it on for a good day, but intend to mount it in the car tomorrow...

On another note, I keep seeing warnings about turning off the radio while it's writing to the SD.

How is a 'power disconnect' handled?

Accessories in my car are wired to a second battery, which runs for roughly an hour after I turn the ignition off. So generally I simply leave the scanner on, and turn the car off and it's automatically powered off after an hour.

Will this cause a problem?

315. Re: [BCD536HP] 536 not saving date / time?

Topic: 314 Message: 315

A week? I don't know of any scanner that will run a week on a charge. 8 hours maybe depending on a lot of factors including backlight settings and traffic.
To charge it takes as long as 14 hours the first time. I however suggest a separate charger!
Clock, set it and let the scanner run an hour and it will be OK

Oh, and ALWAYS shut the scanner off manually or the card can get corrupted. An improper shutdown like when it is writing to the card can cause many issues

As far as having the radio turned off by removing power instead of using the on/off switch on the radio... I have a mobile installation using a center console. I feed 12 volts from the battery to a terminal strip with 14 gauge stranded copper wire. From the master switch

On Feb 2, 2014, at 3:48 PM, Evan Platt <evan@...> wrote:

So I can't find it in the manual, but I know I read something like keep the 536 plugged in for at least 50 hours to charge the internal battery, and the battery should last a week.

So plugged in the 536 yesterday around noon. Left it on for an hour. turned off radio - non switched outlet, outlet is always on.

Turned radio back on today (just now) and get the error set date / time.

Shouldn't the battery charge while the radio is off? I guess I can leave it on for a good day, but intend to mount it in the car tomorrow...

On another note, I keep seeing warnings about turning off the radio while it's writing to the SD.

How is a 'power disconnect' handled?

Accessories in my car are wired to a second battery, which runs for roughly an hour after I turn the ignition off. So generally I simply leave the scanner on, and turn the car off and it's automatically powered off after an hour.

Will this cause a problem?

The first reply was sent prematurely... Continuing... There are two terminal strips, one positive, one negative which have a master switch so anything I connect to the terminal strips can be either left connected to power or isolated from power with the one master switch. I power 4 radios this way. The 536 has not displayed any problem as yet-don't forget it's only been a week... But I know if I turn off the radio this way I won't allow the radio to write any changes I may have made to the SD memory chip. But I am wondering that IF, when I DO make any changes, I power the radio down using the power switch on the radio, which saves the changes, and then turn it back on, and when I'm leaving the vehicle, throw my master switch without the worry of loosing any settings might work. So far it's doing it but I would like to know if there are any other settings that would not be saved, or lost when I only use the master switch.

Umm.. the 536 is the mobile :) I Swear I read somewhere that the date / time is kept on an internal battery when the radio is off, and that battery needs about 50 hours to charge, and will then retain the time for up to a week if the scanner is unplugged.

Wow, I would hope there would be some 'contingency' for that such as lost power. With cars being what they are, it's totally possible to lose power unexpectedly! Maybe even a quick power off when starting the engine...

The scanner won't hold charge a week - the clock memory will.

The issue likely comes when the scanner is actively writing the SD card. But, you never know when that is. It's akin to simply pulling the plug on a Windows PC - most times, no problem.

If you read the same thing I remember reading it said the scanner has to be plugged in AND turned on for 50 hours to fully charge the internal battery, at least that's the way I remember it. It seems stupid that the scanner needs to be turned on to charge the battery but I'm not an engineer so maybe there is a good reason.

I see, there appear to be many reasons why that could happen. Many that can't be diagnosed without knowing your programing.

Will say this compared to a PSR-500, the 536 is doing better in my area. Sometimes it's slower on the uptake and other times the 500 is.

One thing I have done to improve reliability with a 396, 996 and the PSR-500, is to program the system in 2 sites, one attenuated and the other not attenuated. I've also done this in the 536 but results are inconclusive as to if it is helping. (the line on the display that tells me which site it's receiving on is replaced when active, and I have switched to one of the other display options yet). That way when the signal is too strong, it receives via the attenuated system, and as you get away from the tower the non attenuated site grabs the traffic. Of course doing this adds an additional delay factor, still I find the delay more desirable than receiving silence.

Thanks for the input. I spend about 20 minutes with Uniden Tech support yesterday with no resolution. He did state that there have received other reports regarding the P25 reception under various other situations and conditions. If this is a general issue with this new unit, they will hopefully diagnose and come up with a bug fix. Let's see what happens as more 536's hit the street.

What this poster calls sensitivity is not that. If the scanner wasn't receiving it it would be a sensitivity issue. But the chopped comms is completely different and has usually been due to a priority of one sort or another being on and the user not knowing it or realizing it.

All priorities are off. I checked. This issue was right out of the box. There are not any on onboard P25 adjustments in the unit for P25 digital systems. There are for P25 conventional systems. Uniden acknowledges there is some sort of issue with the 536's.

327. Will the new wireless capability do away with the need for a host PC?

Yahoo group: BCD536HP
Date: 2014-02-04 22:56:59 UTC
From: Steve Smith
Topic: 314 Message: 327

Does anyone know if Uniden will be creating a Windows app that will connect to the BCD536HP directly through the network via the wireless dongle and let you monitor the scanner without connecting the scanner directly to a PC?

I'm also wondering if Uniden might be creating firmware that will let the BCD536HP do a radio feed to RadioReference without the need for a host computer.

Steve Smith

Odd, I have only heard of one or two having clipped audio, and those were both due to a priority or WX being on. No word of a problem, other than the squelch tail that some are reporting and a couple unrelated items.

I could forsee a Windows App to connect / control the 536 over wifi, but a app that let's the 536 stream to radioreference without a PC? I seriously doubt it. too much processing would need to occur on a scanner.

330. Under what conditions should the 436/536 revert to last state?

Yahoo group: BCD536HP
Date: 2014-02-05 00:01:58 UTC
From: Evan Platt
Topic: 330 Message: 330

So - let me clarify - I thought the x36 should 'save' what status I was in, so if I power off and then power back on, it would be just as if I never powered off?

Here's my test:

Let's say for the sake of argument, I'm holding on System A. Fire "Department". and holding on ID Fire Dispatch 1.

Turn power off. Wait. Turn power back on. I'm back as I was - System held, department held, ID held.

Now, I'm still holding on System A. Fire Department, but in ID Scanning mode.

I power off.

Now I've noticed two different things happen.

Previously, NOTHING was "Held' (Hope I'm using the right terminology?

Basically I was scanning all systems.

Now - I was doing the above steps as I wrote to make sure I wasn't missing anything - when I turn it back on, I'm on a completely different system, completely different department, completely different channel, but held.

And then ran test again, and went to the nothing held mode.

Am I missing something?

Yes, performed firmware upgrade out of the box.

Seeing the same thing on the 436 and 536.

Thanks :)

I just got my 436HP. I was surprised to find NO power cable. You have to charge it via your USB port. What do you do when you travel without a computer?

Considering the cost of the receiver, you would think they would provide a charging cable.

Pat

They did provide the charging cable. It's the USB cable. For AC or 12V use, buy an adapter for a couple bucks at Walmart if you don't already have some laying around.

I guess Patrick's point is they should have included the USB to a/c
adapter. It's a $5 part.

And charge more for the scanner when most people wont use the adapters? Sounds like a situation I have with adapters laying around in the drawer. Like I said, many people already have USB adapters.

Well, I'm just saying, I personally have 20 of them lying around. It seems everything I buy - a $10 item even - comes with them. It's not out of line to think a $500 scanner shouldn't include one.

You can find them on dx.com (cheap stuff shipped from China) for $3. That's Me. Buying ONE. SHIPPED. from China. If Uniden bought them in bulk, I don't forsee Uniden paying more than $2 each. That would hardly make Uniden "charge more" for the scanner.

Due to California regulations, we were unable to include any power adapter, only the cable.

You can get a cheap USB charger at most gas stations. Or, as I do charge the batteries outside the scanner. I use the mobile setup to run the scanner while traveling, works nicely.

Really? Wow.. I love California more and more every day LOL..

Don't get me wrong, I'm not slamming Uniden for not including it, they're easy enough to find. And if there's a CA regulation that says you can't, I guess you can't really make a seperate 'California' Package.

What is the regulation, do you know offhand? I've bought a lot of stuff that includes one, so I'm wondering are these other companies skirting the regulation or breaking it?

I have a bunch of AC USB boxes for use to charge the unit. I also have one for the car.

Another issue: It seems that if you have a USB cable plugged into the scanner, it will not let you use the unit. For extended use, it would be useful to be able to power it directly.

Pat

I don't think you meant to send that reply to Paul....

I'm pretty sure Paul knew what was in the box :)

I charge my batteries seperarely and only use them when walking in stores etc. Sitting at home I use the netbook to power the 436. On the road I use both the 436 with a usb adapter and the 536 on the 3 wire power cord.
On power up select ./no and you can scan using the cable and not off battery power. Note that the batteries will not charge though! If charging batteries via the cable the unit can't scan as there is not enough amperage with USB to do both scan and charge.

Which is exactly what happened with the BC346T - Uniden had to redesign the scanner to remove the charging circuit due to CA law. I'm sure that cost them a LOT of money to do, and I don't blame them for being gun shy. I didn't think of that before. So, it looks like Uniden is complying in the way that least impacts the customers - merely requiring the purchase for a minimal amount *if* you need the adapter. I charge all my cells externally, so it's a non-issue for me. I use my scanners as scanners, not battery chargers.

On the 436, yes - in the upper right corner same as several previous models. Battery low alert, too.

Press 'down' the volume knob, and the upper right corner will display the voltage.

To clarify...

BC346XTC

The BC346XTC is functionally the same as the BC346XT with the following exceptions:
• In order to comply with California Energy Commission rules, the battery charging function has been removed.
• Rechargeable batteries are not included with the product.
• The battery charge time option has been deleted.
• The battery select switch has been removed from the battery compartment.
For all other features and operation, refer to the instructions for the BC346XT.

Given this alternative, I can live with having to buy an adapter should I want one.

Something to keep in mind: I have a drawer full
of USB chargers, too. Many come in different
output voltages. Try to match the DC input
voltage and amperage as close as possible to the
scanner for best results. A lower input voltage
than the scanner is rated for will work, but it
will take longer to charge. The scanner will
draw only as much amperage as it needs, so a
larger input amperage is of no concern.

USB adapters should come in 5V only. The current should be at least USB spec of 500mA, so any adapter should work.

Joe,

My Nexus 7-2 USB charger is 5.2 volts. No big
deal. Amps between my many chargers run from
500ma to 2.1 amps. I have noticed a longer time
to charge electronics if they require more
amperage and you are using a charger will much
less amperage. I should have commented about a
lower input amperage rather than voltage.

If you measured that with no load connected, then a higher voltage is not unusual. Most regulated DC power designs only regulate well when the supply is under a load (i.e. some device drawing some current).

Ni-Mh batteries have a flat discharge cycle. Knowing the voltage does not tell me how much of the original charge remains in the battery

It's not that flat. My portables run from 4.2 to 3.4V (alert comes on at 3.5V) which is plenty of an indication of battery life left.

From: Evan Platt
Topic: 364 Message: 364

Looking at an urgent quick need to replace my mobile speaker - anyone used the Uniden BC-20 speaker?

Is it fairly loud?

Thanks :)

365. Re: Comments on the BC-20 speaker?

As an alternative, looking for a amplified / powered speaker. Need it by Saturday, so hoping something Amazon prime, but not seeing anything decent there. the BC23A shows out of stock :(

Bought my Bearcat amplified speaker from Walmart online and paid $30. Checking the price of this speaker showed around $40 as the next cheapest price. Do a search on Walmarts website-if you can't find it listed I will do a search and get the stock number Walmart uses and post it here. (There was one guy who didn't find it listed on their website so maybe it's a regional marketing thing)

376. ARC536 from Butel - Warning!!

Yahoo group: BCD536HP
Date: 2014-02-06 20:24:28 UTC
From: Patrick
Topic: 376 Message: 376

I preordered ARC536 from Butel. They immediately charged my credit card. They then sent me a beta version. It is unacceptable to me. You cannot upload or download groups of favorites lists. You have to do them one at a time. Each download replaces the previous list.

I requested a refund. Their policy is no refunds on software because they permit you to download an evaluation version at no charge so you can test it. Since no evaluation version is available, this restriction should not apply.

To date, they are saying no refunds!!

I think its a BC23A, or something close to that. But it needs to have an A in the model number. It separates their regular non-amplified speaker from the amplified one.

Take a breath.
The email they sent about the beta version mentions this is a beta and test version.
They asked for our feedback.

I have tried it and it does need some tweaking. I am confident that they will finish with a confident version.

Topic: 364 Message: 380

But an amplified speaker is in general going to be much louder, correct? Or is a <X> watt speaker and a <x> watt speaker (amplified) the same volume? (assuming X is the same in both cases)?

Reason I thought amplified was louder is I've had a number of speakers. I don't know the wattage on them, but similiar sized speaker, I have a Rat Shack Amplified speaker that's twice as loud as other speakers the same size...

It was explained we were to expect a beta version to play with, identify corrections, and submit your findings. As the program matures, all of the expectations will be satisfied. Since Uniden hasn't finished submitting all programming parameters as yet, there is still input Butel has not seen so give it a break. No one is trying to cheat us.

The Sentinel software was a big part of the reason I was considering not buying a 436HP. I was pleased to read that Butel was releasing software for it. I never owned a HP-1 and didn't know about ARC-Patrol. Which apparently is what ARC536 is based on.

I'm going to gamble $30.00 on the new software and see how I like it. If I don't buy a x36HP, I'm only out that much.

From: Gary Saffer
Topic: 376 Message: 388

I have used Sentinel enough to know that it's a kludge. Uniden should stick to hardware, because none of their scanner software is worth crap. The same goes for EZScan for that matter.

I have a ton of files set up in ARC-XT, so it will be much easier to convert that to the new ARC software. From my experience with Sentinel (several hours), my experience with Butel software (hundreds of hours across several Uniden platforms and PSR600, and my experience with EZScan (way more hours that I should have needed) with the PSR800, I can determine pretty easily if the new ARC software is going to fit my needs.

That will help me decide if I want to spend $500.00 on a scanner that I might decided I don't like.

Get it now? If not, maybe a grown up can explain it to you.

Sorry if it has been addressed already, why is the external speaker jack on Uniden home scanners stereo? I am planning on using a Motorola amplified speaker. Will I need a stereo to mono adapter for this set up?

Thanks in advance!
Curt

It isn't. The external speaker jack is a mono jack. Only the headphone jack has a stereo plug (but the audio is monaural).

394. Will there be a UBCD536HP European version.

Yahoo group: BCD536HP
Date: 2014-02-07 18:31:47 UTC
From: <zb3bgib@...>
Topic: 394 Message: 394

Hi All, As a scanner enthusiast, & Bearcat fan, & living in Europe, I have been looking up the new Uniden Bearcat UBCD536-HP, & seem to like the specs, even it's looks so I will be getting one in the long run, now my question is will there be a European version of the UBCD536- introduced into the European market ?,
If so will the frequency coverage be the same,?, & what functions will differ to the U.S. Version ? I ask this because I recently obtained a new BC125AT, which I loved, then sold it to obtain the same radio, but this time the BC125XLT european version with more frequency coverage than the U.S version, though some functions are different, but just love it. So if a european version is to be introduced, I would appreciate the info, & I guess it would be a matter of waiting time.
Thanks in advance.
De, Ron. ZB2B.

399. Loss of audio

Yahoo group: BCD536HP
Date: 2014-02-08 05:44:00 UTC
From: SmokChsr
Topic: 399 Message: 399

Not sure of the cause, but I've seen this with both a 396 and now the 536, that the scanner will occasionally go silent. If you look at it you see it's receiving yet there is no audio. From my observations once it goes into the "muted" mode it will not come back until cycled.

In both cases turning it off and back on (rebooting) resolves the problem. With the 536 I checked after restarting and the missed audio was in the playback. So it did receive and properly decode but for unknown reasons the audio output had silenced.

I'm throwing this out there just in case it's something that can be corrected in firmware. It seems to be more of a soft/firmware error than a hardware failure.

400. Siren App

Yahoo group: BCD536HP
Date: 2014-02-08 12:26:54 UTC
From: N1CHU
Topic: 261 Message: 400

Got two of the 536's solely with the intent of pressing the Siren App into service. Got my Ipad mini mounted in the vehicle anticipating a Ct. to Fl. trip March 5. Last I heard was problems with the app have delayed the release until the first quarter of this year. Well, it's about half way through the first quarter with no further word on expected release date. Kinda hoping Upman would be ready to offer up an update. On another note, the aforementioned trip... Can someone offer up the parameters (how to set up my 536) to make the trip using GPS coordinates whereby the radio automatically captures systems as I approach them and drops same as they appear in my rear view mirror? So far I figure I use the national database and set the range. Not sure on how I ensure the radio uses the lat/long info or if it's even included in the data. I haven't tried a test run in Ct. It seems the GPS coordinates for the conventional stuff all sport the same lat and long-I suspect the small size of my state requires just one or two locations so my doing a test run locally might not be a good indicator of this type of tracking. I am however playing with the idea of setting the range to zero and manually entering town specific GPS data in my local and then drive in and out of various next-door towns to see if I've got it right.

Plug in the GPS, select what types of services you want to listen to, sit back and let it do the rest. It is a seamless integration.

I caem down from CT (by plane) and am in JAX right now. Nothing much to listen to as most all of PD JSO etc is encrypted.

No, close call wasn't enabled. Also it should be noted that when this happens there is no audio output what so ever, including key press beeps. So basically it's like something is shutting down or muting the audio amplifier completely. It's quite intermittent with no attributable cause that I can come up with yet.

For RW this does not present like the P25 decode threshold issue. I'm aware of that one as well.

FWIW, I'm a techie, quite comfy doing component level work even on SMD, Radio Engineer, two way tech, HAM extra, FF/PM, and news photog. Now that's not saying I won't push the wrong button and screw things up, just that it's more likely that I will realize I messed it up before I post something. :)

KD4QOF, now lets see who all checks QRZ :)

Hi,

New BCD536HP user. How does one make a custom scan folder?
Would like to scan only individual frequencies in a group -- like --
120.325, 406.6, 419.225 ect.

Comments welcome,

Thank you.

Greg

Yes it does, and the fact that the audio that was last received was recorded into the scanner and able to be played back after rebooting, proves that the receiver, was properly receiving and decoding the transmission.

Without knowing exactly how the audio flows in this unit I can't properly determine what the problem is. All appearances are that a mute is being activated and held active.

Also to clarify, you can also see a good signal with no audio due to a decoding issue. The difference being that the audio will return on a later transmission. In the case I'm speaking of, restoration of audio requires a power cycle, also ALL audio is gone including keep beeps, I think you will find that key beeps are still heard with decode problems, but I haven't verified that.

What are you going to use for programming software? I started responding using the steps in ARC x36 software but realized I'm using the beta as the final program is not released yet. Up to beta # 5 so far and it's starting to shape up nicely. Hopefully soon a pro beta version will be released. But I don't waste time messing with the software that comes with the radio. It's just frustrating as I find it lacking in ease of use. I believe an obstacle slowing the aftermarket software development is Uniden's Siren App drivers, or lack of same. I must be the cause of some embarrassment over at Uniden.

Hang in there, it's coming. Sorry I can't help but someone else will respond to your request for help.

Thanks I will keep an eye on that I think you are right that it would be a firmware issue. I will have to try
the replay feature. I have found this issue in rebanded simulcast Have you noticed any other specific systems or is it a global problem?

417. 32 GB microsd cards on sale

Yahoo group: BCD536HP
Date: 2014-02-10 21:43:58 UTC
From: Evan Platt
Topic: 417 Message: 417

http://www.buydig.com/shop/product.aspx?sdtid=6709124&sku=SAMMBMSBGBAM&ref=cj

$17.99 shipped .

I have no affiliation with buydig.com . I make no money from your purchase.
Blah blah :)

Seems like it might be time to upgrade the included cards.. :)

I'd like it better if it was a faster class 10 card.

For me the selling point would be the waterproof, shockproof, etc. qualities.

Why? The OEM card is class 4, so I doubt a Class 10 card would improve anything

Longer recording time mainly.

Also more channel capacity, but the entire RR dB takes up only 1% of the stock 4GB card, so...

The problem only affects the 536HP, not the 436HP. Uniden is working out the logistics of either repairing or swapping the units. They recalled some units from vendors and are shipping replacements. They were able to identify the problem (an out of value component) and engineer a correction.

There is a pretty detailed thread over at Radiorefence about it. In fact, it was end users over there that alerted UPMan to the problem.

It doesn't affect all 536's either. Only those with the wrong part are affected. The way to tell is if the unit has a lot of noise when using headphones. If not, then that unit is not affected.

I checked my two 536's and don't have the problem so I'm good on that point. I'm just waiting (and getting more annoyed by the day) for the Siren App. It's the sole reason I purchased the two... Had it not been for this app I would have stuck with my 996XT. But what are ya gonna do? I know the technology is there, remote baby monitor cameras can be piped over the net with only a noticeable delay measured in seconds so the Siren WiFi shouldn't be a problem-so what's holding it up? Hope it's not some intelligent property infringement issue...

Yes, thanks. I forgot to mention that part. Also, the noise is only
there when a signal is being received. If the scanner is just scanning
and not on an active channel or talk group, the head phones are quiet.

Uh, did you send the post and then immediately realize you shouldn't have? Because all you have to do is plug in a headset or earphones and listen to the quality of the audio, compare it to what you hear without the headset or earphones from the built in speaker and magically you will have the answer to your question. If Uniden does narrow down the batch of scanners that need fixing they can give us a start and stop serial number which definitively will identify those that need the fix.

435. Re: [BCD536HP] Recall?

Plug a set of headphones into the jack and listen. If there is white
noise when you receive a transmission, then you have the problem.

Apparently Uniden is extending the warranty for all units in the serial
number range to three years whether it has the problem or not. They are
still trying to determine the exact range of serial number potentially
affected.

To Gary - and you - my question was is the problem "All the time". I've worked in the computer industry for over 20 years,and we send laptops in for repair for headphone jack issues all the time. So my question was valid, and YES, I did read the thread.

There was no indicaition on these threads that the problem is constant - ie it's 100% of the time, hence my question.

Instead of answering with "Maybe you should read the thread again", you should read my question again, where I plainly asked a simple straightforward question - that does the problem occur all the time.

We have many times a user brings their laptop to us complaining that the headphone jack makes popping noises. We plug a headphone in and it sounds fine. And it's only then that the user tells us that the problem is only some of the time, so we have to listen to headphones for a few hours.

I simply wanted to know if I could just plug headphones in, and listen to audio for a minute , and if it's fine, it's fine, or if I'd need to listen for a few hours to hear that the problem is not always there.

Thanks.

Its also possible that some in the range could be fine. Since we don't know the part involved its possible that good and bad parts got mixed together and that could mean hit or miss on whether its going to affect you.
We had that happen when they gave workers the wrong resistors. The resistors were mixed and no one noticed until the shipment hit the next company in line. We had to go there and check 2500 parts and fix the ones that had the wrong resistor before the other company could install the boards. What a pain!

Even, it's constant. Whenever a signal is received, the noise is there.

Uniden traced it down to a production error at the factory. The
manufacturer replaced the specified part with one that has different
specifications. The fix is to bring all of the affected units back to
Uniden America and replace the part with an in specification part.

They are building up a stock of replacement units so that they can do a
quick turn around. Details are still be worked out.

Gary,

Specifically, this white noise you refer to... Is it covering the audio? I am defining audio as someone speaking in a normal voice. Because if the signal is not DFQ (dead full quieting) it's going to have white noise accompanying it. The weaker the signal the more white noise is there. It gets better... Digital signals are either DFQ or not there at all. So of course it it's a digital signal you are listening to, and hear white noise... Se what I'm getting at?

Bill

On Feb 11, 2014, at 4:09 PM, Gary Saffer <ghs159@...> wrote:

Plug a set of headphones into the jack and listen. If there is white
noise when you receive a transmission, then you have the problem.

Apparently Uniden is extending the warranty for all units in the serial
number range to three years whether it has the problem or not. They are
still trying to determine the exact range of serial number potentially
affected.

Evan, it's a moot point if Uniden identifies the radios by serial number or batch and declares all scanners in that group are eligible for the fix. It's not an issue of repairing computer jacks or re-reading a post. Someone did state it only happens when there is a transmission in progress. That equates to the squelch setting being met or exceeded.

I can't answer that as I don't have a 536. From the thread on Radioreference, it's loud enough to be distracting. It's not relatd to signal strength, it's a problem with the scanner itself.

443. Question Please

Yahoo group: BCD536HP
Date: 2014-02-12 02:00:45 UTC
From: Scanner1143
Topic: 443 Message: 443

I have not ordered this BCD536HP yet.
This is my 1st post to this group.
Do you have to be a member of Radio Reference in order to
use this radio? Is the software that communicates to your
desktop computer built into the scanner or what?
Can it be used on a Windows XP system?
Do you have to have a driver like the 996XT before it will work?
I am use to programming my scanners with software!

Please forgive me in advance for my unfamiliarity of this scanner.

Thank You!!

Thomas

Do you have to be a member of radio reference? No.
The software that you use can be downloaded from the internet - Uniden Sentinel software. Can it be used on XP? I believe so.
It should be plug and play since it will be recognized as a USB drive. It was in Windows 8.1 . Can't say for sure about XP, maybe someone else here can confirm.

There are a ton of features of the 536 - quick keys, number keys, startup keys, FTO, Close Call, more tactile layout (physical keys rather than touchscreen), DIN mounting, real volume and squelch knobs, the scroll knob, and more I can't think of right now.

So far... My comparison between the two...

1) the BCD536HP has more volume-but I doubt you can compare the two as one is deliberately designed as a table top model that has portability with it rechargeable batteries and the other as a mobile.

2) the BCD536HP has a better receiver-I'm saying this without comparing the specs. My observations were made with keeping as much the same as possible, like the antenna, and placing it in as exactly the same spot as possible, etc.

3) I can't think of anything more offhand... Time for others to add to the list...

A cheap way to compare two scanners is by using a 'T' at the end of the antenna line. There will be some loss, but it should be fairly equal on both receivers. Use the same type/length jumpers between the 'T' and the receivers. That way, you eliminate effects such as signal path changes due to time, power, or antenna placement.

464. Squelch tail after transmission

Yahoo group: BCD536HP
Date: 2014-02-14 14:47:48 UTC
From: <jboehner01@...>
Topic: 464 Message: 464

I have loaded up the scanner using my zip code, and have both conventional and trunking systems that are being scanned. After the Analog trunking transmissions, there is an annoying squelch tail (loud). This is not happening on P25 systems or conventional. I did not have this problem with my BCD996XT.

My apologies if this has been addressed before, as I couldn't figure out how to search the archived messages on this group.

Not sure if UPMAN is part of this group, but if there is no setting that I can change, hopefully he could address the question.

It's been discussed and Uniden is aware. Setting the "end code" to "ignore" helps considerably.

Also shutting unit off for a minute will in most cases help for a while. It takes a day or two for it to start the long squelch tail.

473. SAME programming/ I-CALL

Yahoo group: BCD536HP
Date: 2014-02-15 23:00:41 UTC
From: James F. Boehner MD
Topic: 473 Message: 473

This should be a simple process, but I've followed the instructions in the owner's manual, and still having problems:

I selected the SAME group, went to SAME 0 and edited the name to my City, which has its individual FIPS code. I then hit enter, but there is no query for the SAME code. I would not think that it should be entered as an alphanumeric after the city name- should it?

So, I went to sentinel and downloaded the radio. In the WX section, I now see my city name. I entered in the FIPS codes and uploaded the profile to the radio. I can't find the FIPS codes via the WX menu system in the radio.

What am I missing?

Second, is there an easy way to activate reception of ICALLs after downloading data via Zip Code? In the 996XT series the wildcard ".0" was used as a talkgroup. Is there any way that this could be set up in the Menu to activate an I-CALL Flag, UPMAN?

On a good note, I am no longer getting the annoying squelch tail after analog trunking reception.

Thanks!

From: <bob.torio@...>
Topic: 477 Message: 477

II listen to a certain department almost exclusively so I can only speak for these talk groups. I noticed that my 536 will seem to lose something and not play the groups. My GRE 800 doesn't have a problem. I reconstructed my dB and reloaded the scanner and it corrected the issue until turned the scanner off and on again. Could it be a bad SD card or a firmware issue ? For all I know, it could be an issue with other systems. Thanks all.

Joe.
Thanks for the info. I am a gardian/carevgiver for my wife so it takes me a little longer to reply.
I finally got the favorites cleaned up. Had two of some of them and I thought I had gotten rid of them but it took a couple of tires. I would delete them in sentinel, write back to the 536 and they would still be in the scanner, so I deleted them in the scanner and checked things with sentinel to make sure. Found the menu item where I could turn favorites on and off....without using the favorite keys. Still haven't got that working to soot me.
BTW what is all this about virtual control...did I miss something?

This is on Windows 7 - Figure out the location here the drivers are downloaded. Right Click (My) Computer, select Manage, open Device Manager, expand Ports, open Uniden Serial Port (COM#), (that Com port number might be handy later in a different context so pay attention) select the Driver tab, Select Update Driver, select Browse my computer for driver software, browse to (D:\Temp\536HP\serial drivers) [replace with where you drivers were written]\uniden_usbser, Next, and let load. I seem to recall an additional Windows checking for updates later which I just left run but I'm pretty confident it isn't going to find anything

I think in this context Virtual Control is the Butel ARC536 Beta desktop Virtual Control.
As stated previously, still a little buggy and incomplete but a lot of fun to play with

Joe.
Thanks for the info. I am
a gardian/carevgiver for my wife so it takes me a little
longer to reply.

I finally got the favorites
cleaned up. Had two of some of them and I thought I
had gotten rid of them but it took a couple of tires.
I would delete them in sentinel, write back to the 536 and
they would still be in the scanner, so I deleted them in the
scanner and checked things with sentinel to make sure.
Found the menu item where I could turn favorites on and
off....without using the favorite keys. Still
haven't got that working to soot me.

BTW what is all this about
virtual control...did I miss something?

485. P25 Improvement Test

Yahoo group: BCD536HP
Date: 2014-02-20 15:42:50 UTC
From: Uniden UPMan
Topic: 485 Message: 485

We've been investigating the various reports of degraded P25 performance in some areas and noted with interest when reports surfaced that changing from NFM to FM mode improved P25 decode performance. We have tentatively verified this, but would like some more confirmation if you don't mind. Here is a relatively easy way to check:

First do MENU --> SETTINGS --> BAND
DEFAULTS
Then, scroll to the setting(s) that have the frequency just
below the range your local system is using. For example, if you are monitoring an 800 MHz system, scroll to the line that looks like:
849.0:NFM/ 12.5
MHz
Press E and scroll to change NFM to FM.
Press E two
more times.
Then, check to see if there was any performance
improvement.

For conventional P25, you'll still need to set MOD for the
individual channels.

Based on the feedback we get from this, we'll be
able to make adjustments that should reflect optimum settings w/o you having to tweak around with these settings.

Oh, and if your P25 decode is just
fine, please do the above and see if it degrades your decode performance. We don't want to issue an update that fixes half of you but breaks the other half.

Ummm.....

It appears that someone forgot that narrowbanding (going from 25KHz channels to 12.5KHz channels) only applies to VHF and UHF (up to 470MHz and new systems in 470-520MHz, existing 470-520MHz systems can remain at 25KHz spacing until the FCC figures out what to do with that spectrum)

800MHz Land Mobile has always been 25KHz channel spacing

900MHz Land Mobile has always been 12.5KHz channel spacing

487. BCD-536HP White Noise With Headphones

Yahoo group: BCD536HP
Date: 2014-02-20 18:26:28 UTC
From: <kstrsdn@...>
Topic: 487 Message: 487

I have been reading the thread about the white noise on receive with headphones. I checked mine out today and have that issue. I called Uniden and found out that there is no plan in place yet for returns and was told to check their web site periodically under repairs for updates on the 536 issue. I asked if all units were recalled from the retailers and he did not know this. I am going to attempt to call the store I bought mine from to see if they were requested by uniden to send their old stock back. If this has happened with the retailer and has received new stock, I am going to see if they will do an exchange. This is very disappointing to say the least not to mention being a big inconvenience.

We have no ability to contact dealers to have them return inventory except through public forums. We do not sell directly to dealers so have no idea who they are or what their contact information is.

Dealers will use the same return process as end users. This process will be in place next week. There is a sticky thread in the Uniden Forum at RadioReference that will be updated with the specific details. (http://forums.radioreference.com/uniden-scanners/283740-bcd536hp-headphone-issues.html) and additional discussion about the issue with current updates from me at http://forums.radioreference.com/uniden-scanners/282877-bcd536hp-headphone-related-issues.html.

Topic: 485 Message: 490

That's mandated narrowband that apply only to 136-470 MHz Land Mobile. While 470-512 and 800 are not required to narrowband, users CAN use narrowband modes and P25 I particular comes in both FM and NFM varieties.

Test

We've been investigating the various reports of degraded P25 performance
in some areas and noted with interest when reports surfaced that changing from
NFM to FM mode improved P25 decode performance. We have tentatively verified
this, but would like some more confirmation if you don't mind. Here is a
relatively easy way to check:

First do MENU --> SETTINGS -->
BAND DEFAULTS
Then, scroll to the setting(s) that have the frequency
just below the range your local system is using. For example, if you are
monitoring an 800 MHz system, scroll to the line that looks
like:
849.0:NFM/ 12.5 MHz
Press E and scroll to change NFM
to FM.
Press E two more times.

Then, check to see if there was
any performance improvement.

For conventional P25, you'll still need to
set MOD for the individual channels.

Based on the feedback we get from
this, we'll be able to make adjustments that should reflect optimum settings
w/o you having to tweak around with these settings.

Oh, and if your P25
decode is just fine, please do the above and see if it degrades your decode
performance. We don't want to issue an update that fixes half of you but
breaks the other half.

It wouldn't matter since that does not affect the channel. That only affects the frequency the scanner tunes to next in a search mode.

Preliminary indications are that it may have provided some improvement,
currently no indication of any complications.

Larry,

Don't change anything other that what UPMAN suggested.

My post was a general comment only.

The channel step setting in the scanner only comes into play when searching a frequency range.

You bring to light a good point though, with all those units running at once, how would one control all of those with the wireless option for the android device? You hit on an option for having a remote head that was wireless but I still see some confusion there regarding the device, it's remote head, wireless, (wi-fi) and the tablet.

Once simple solution might be to have the tangible remote head, with all it's buttons, display, dials etc, and have it connect via bluetooth to it's paired unit. That way you're covering all bases with no confusion. Uniden already has bluetooth technology in other devices, seems it'd be easy enough to do, although it probably wouldn't happen with these units (the BCD*36HP) because they don't currently have bluetooth capabilities. Still something to consider for the future.

499. Removing power from scanner before turning it off

Yahoo group: BCD536HP
Date: 2014-02-23 14:39:31 UTC
From: N1CHU
Topic: 499 Message: 499

There is a warning against removing power from the scanner before turning it off. It would prevent the scanner's ability to write any changes to the SD card before it shuts down. The question was raised "Just What may be lost?" I will not try to answer definitively but since I do run the BCD536HP in my truck in a radio console with amateur radio gear, I have wired the console directly to my battery with a master switch and isolate the entire console. I leave all radio power switches in the on position and just throw the master. It has been my observation that although supplying or divorcing power in this fashion is not recommended by the manufacturer, the practice has done nothing to cause me concern as far as the operation of the radio is concerned. Of course, I do first turn off the scanner using the power on/off switch FIRST when I make any settings changes in order to allow the radio to update the SD card. But once the update has been written to the SD card, I go back to using the master power switch and leave the scanner power/volume setting knob alone. The previous BCD996XT never exhibited a problem with this practice either but that's not to say I recommend this. Your results may vary. So take it for what it's worth.

Bill

If you want to do the same thing but more safely, you can get a RigRunner 'S' model that can use the scanner as the master radio and when you turn off the scanner, it will write the SD card then shut down itself as we'll as shut off any slave radios you have powered from the RigRunner.

Thanks Joe,

I have to look at that more closely. I do have something coming that will kill power after a set time, should I forget to hit the master. But I like your application better.

Joe,

Regarding the RIGrunner model 4010S... Can't find a better description of the on-off-auto feature... When you turn off the master radio, the remaining 9 output terminals will also loose power. But I don't see where it allows you to set the power off delay time, where the master radio is still powered for a certain amount of time, allowing the SD card to be written to before the rigrunner turns off power. I will look for the manual online to see if there is a better explanation of how it performs regarding this. Of course, if you are running more than one BCD536HP, the second scanner would have to be manually turned off using the radio's on/off switch to assure the SD card gets written to before turning off the master radio... But since that is only necessary if you have changed settings, which is rare in my case, it's not a concern. (I have two 536's with no current intention of running them both in the truck, but never know what the future will bring.)

506. Re: [BCD536HP] Removing power from scanner before turning it off

Yahoo group: BCD536HP
Date: 2014-02-24 12:41:32 UTC
From: N1CHU
Topic: 499 Message: 506

Oops, sorry Joe,

It looks like I didn't read the description closely enough... I guess the master position never looses the supply so turning off the master radio manually takes care of all additional radios AND can write to the SD card if need be... I bought the lesser rigrunner instead so I lost out on that feature. However, I do have a power supply device coming that will shut off all power to my radio console after a predetermined amount of time when the ignition is turned off, saving my battery should I forget to throw my master switch, which was my main concern. (I have found that my battery lasts about a day when I forget to turn off my console. A dead battery concern is why I started looking at all the available options.)

The main difference is: Xt radios do not use a sd card for storage.

Be careful, as you will corrupt the card if you don't follow what the manual says.

There is always that... SD cards have needed to be reformatted with the GRE PSR-800 when following proper procedure, and yes, not shutting down properly-the way UNIDEN states-is pushing the envelope. That's why I put the disclaimer in my post... "Your results may vary." But so far no problems. The Rigrunner 4010S should suit my needs when used in conjunction with a power supply offered by Ram Mounts. It shuts off all power after a pre-determined amount of time. So I turn off the ignition, then the 536, using the on/off switch on the radio (the rigrunner then automatically kills power to its remaining power posts) and the Ram component shuts down power to the Rigrunner after 5 minutes or so because it monitors the ignition switch and times out. The only concern is a notice by the RIgrunner people to keep the fuse values close to what is called for... for what's plugged into that fuses terminals. It's something the FET needs to measure in order to function correctly. If any of this doesn't ring true to you let me know. But I believe I've got it right.

That's true about the fuse size. It needs to measure the voltage drop in order to sense the master unit is drawing power. If you use a larger fuse, there isn't as much drop to sense.

I leave all radio power switches in the on position and just throw the master. It has been my observation that although supplying or divorcing power in this fashion is not recommended by the manufacturer, the practice has done nothing to cause me concern as far as the operation of the radio is concerned. Of course, I do first turn off the scanner using the power on/off switch FIRST when I make any settings changes in order to allow the radio to update the SD card. But once the update has been written to the SD card, I go back to
> > using the master power switch and leave the scanner power/volume setting knob alone. The previous BCD996XT never exhibited a problem with this practice either but that's not to say I recommend this. Your results may vary. So take it for what it's worth.

From: <kb9gfb@...>
Topic: 511 Message: 511

I'm sure when I get the hang of it I'll be happier, but I'm having trouble changing my thought process from Banks, Channels, and Talk Groups to the concept of Profiles, Systems, Departments, etc. and getting them correctly programmed in. Hopefully once I grasp the concept I'll be able to use the planning sheets more effectively.

I see where folks may be putting together some instructional videos but I don't see any listed under files. Can anyone point me toward videos or other material that will help me grasp the new way of thinking?

Thanks from an Old Guy with a new toy.

From: Deacon Greg Weigold
Topic: 511 Message: 513

I started trying to learn all of the new concepts on the 996, as my last scanner was a Regency M7000. I understand all of the trunking, and have used the Palmetto 800 system, once upon a time in Civil Air Patrol, here in SC.

But a week after I bought my 996 I read about the new 436/536 scanners and just put aside the 996, figuring I'd see what the new year brought.

Well, I've decided that I would like to purchase a 436 (and maybe a 536 later), and will sell my new-in-box 996, so if anyone knows of someone interested, please contact me off list. Thanks!!

514. BCD536HP Headphone Campaign

Yahoo group: BCD536HP
Date: 2014-02-26 21:24:50 UTC
From: Uniden UPMan
Topic: 514 Message: 514

Thank you for being patient while we set up our BCD536HP
Headphone Campaign. To take advantage of the headphone campaign, proceed to the
following link:
http://repair.uniden.com/rma.cfm
There, you will enter your scanner information. Once we
receive that information, we will reserve a return unit for you and send you a
link to put in your shipping address. This link will allow you to print the UPS
prepaid shipping label to send your scanner(s) back to us. If we do not have
inventory ready, we will send you an email to let you know this…just keep using
your scanner until you get another email from us that has the UPS link.
Once we get confirmation from UPS that they have received
your package, we will immediately ship a replacement scanner back to you. The
scanner we send to you will either be one that has been returned from one of
our distributors or from a previous return. In either case, it will be screened
at every step of the rework process for any physical or other damage or defect and
will be rejected from the program if anything is not perfect.
We are confident enough in our rework and screening process
that we are extending our normal 1-year warranty to 3 years for all scanners
subject to this campaign.
We expect that most people who use this program will have a
replacement scanner in their hands within 1-4 days of when UPS receives their
scanner for shipment to us.
Some very important notes:
1. Do not
send any accessories other than the MicroSD card back with your scanner. The scanner we are
shipping to you will have only the MicroSD card (installed)
and no other accessories. If you do send some or all of your accessories, it
could take several weeks for us to find them and send them back to you.
2. Send your
scanner back within 5 days of filling out the UPS form. After 5 days, we
will remove the reservation from the units we set aside for you and use them to
fulfill other requests. Your replacement units will then ship subject to
availability once we receive the UPS shipping notification.
3. If you
are a dealer returning unopened inventory or a mix of opened and unopened,
your instructions are slightly different. For unopened inventory, we will
request only a count of how many units you are returning. You should keep these
units unopened and return them to us under the program. Opened inventory should
be treated as above, and returned with no accessories other than the MicroSD
card.
4. If you
want your original scanner returned to you, DO NOT USE THE ABOVE LINK.
Instead, use our normal repair process. Instructions for using this process are
at http://repair.uniden.com/repairInstruct.cfm.
The repair process will take from 3-6 weeks, depending on the current workload

when your scanner arrives.
5. This
campaign only applies to BCD536HP scanners with a serial number ending in 2600
or lower, and which exhibit the problem of a high level of noise when using
headphones. Do not return your scanner if it does not have the problem.

UpMan,

How long will this Campaign be available? I
recently purchased mine, but due to other
commitments, I will not be able to set it up and
test it for several weeks. The serial number is
definitely below 2600 as it was one of the first units available from HRO.

Or, should I send it in anyway?

Thanks!

- Mike

So people who bought a brand new scanner that turned out to have
problems will get a refurbished scanner instead of a brand new one.
The people who get the refurbished scanner will get a three year
warranty but those that buy a brand new scanner will only get a one year
warranty.
Is that correct?

Mel

I'd imagine because the refurbished unit would have a card in it.
You won't loose any data IF you save it to Sentinel before shipping your unit back.

You also have the option of sending in your unit via the regular repair mechanism and getting that exact same scanner back repaired.

I think it's rather unrealistic to expect them to send you a brand new scanner. If it were a car, which is far more expensive, they'd offer to repair it, but they wouldn't offer to swap it out for a brand new one.

I've never heard of an electronics company going to this extreme to minimize end users down time in order to correct a problem.

Some people just have unrealistic expectations.

My estimate is because they are taking a unit out of the box for the first returns and they don't want to take the time to remove the card and have to store it and replace it when the return unit comes in. It's hard enough to store the boxes.

Paul,

Wait... I am penalized for NOT having a defective unit? Are you saying the warranty is extended an additional 2 years and covers the entire radio? Or just the headphone problem? Careful how you answer now... The answer won't go over very well with me if I find I loose out on an extended warranty. Especially when added to the failure to support an advertised feature (I saw nothing in parenthesis stating "coming soon" but I may have missed something.) And if any of those so-called "Alpha" testers had a defective radio and missed something as basic as checking to see if headphones work correctly it's time to question your loyalty to them. They simply ain't getting it done. But that siren app works me to no end. And asking for help only twice, no wanting to make a pain out of myself, on my attempt to use an ipad mini to simply enlarge the display for my vehicle application have no responses as yet. I have no problem with the correction procedure-I just relate it to a vehicle recall-bring it in and we will fix it for free. But extend the warranty? By 2 years? You are going to have corrected the bad stock in 6 months to a year. So why 2 years? Should we be thinking what else is wrong? Siren app beta was hinted about for this week but again, I'm still waiting. Tell me I missed that something too?

Trusting Uniden but faith is being tested.

On Feb 26, 2014, at 4:24 PM, Uniden UPMan <uniden.upman@yahoo.com> wrote:

Thank you for being patient while we set up our BCD536HP Headphone Campaign. To take advantage of the headphone campaign, proceed to the following link:
http://repair.uniden.com/rma.cfm
There, you will enter your scanner information. Once we receive that information, we will reserve a return unit for you and send you a link to put in your shipping address. This link will allow you to print the UPS prepaid shipping label to send your scanner(s) back to us. If we do not have inventory ready, we will send you an email to let you know this…just keep using your scanner until you get another email from us that has the UPS link.
Once we get confirmation from UPS that they have received your package, we will immediately ship a replacement scanner back to you. The scanner we send to you will either be one that has been returned from one of our distributors or from a previous return. In either case, it will be screened at every step of the rework process for any physical or other damage or defect and will be rejected from the program if anything is not perfect.
We are confident enough in our rework and screening process that we are extending our normal 1-year warranty to 3 years for all scanners subject to this campaign.
We expect that most people who use this program will have a replacement scanner in their hands within 1-4 days of when UPS receives their scanner for shipment to us.
Some very important notes:
Do not send any accessories other than the MicroSD card back with your scanner. The scanner we are shipping to you will have only the MicroSD card (installed) and no other accessories. If you do send some or all of your accessories, it could take several weeks for us to find them and send them back to you.
Send your scanner back within 5 days of filling out the UPS form. After 5 days, we will remove the reservation from the units we set aside for you and use them to fulfill other

requests. Your replacement units will then ship subject to availability once we receive the UPS shipping notification.
If you are a dealer returning unopened inventory or a mix of opened and unopened, your instructions are slightly different. For unopened inventory, we will request only a count of how many units you are returning. You should keep these units unopened and return them to us under the program. Opened inventory should be treated as above, and returned with no accessories other than the MicroSD card.
If you want your original scanner returned to you, DO NOT USE THE ABOVE LINK. Instead, use our normal repair process. Instructions for using this process are at http://repair.uniden.com/repairInstruct.cfm. The repair process will take from 3-6 weeks, depending on the current workload when your scanner arrives.
This campaign only applies to BCD536HP scanners with a serial number ending in 2600 or lower, and which exhibit the problem of a high level of noise when using headphones. Do not return your scanner if it does not have the problem.

First, I will remind you that flames aren't tolerated, and the quoted post is approaching the point that breeches that criteria. Please remember to keep your posts factual and not emotional. I see some of both in your post.

That said, I know for a fact that Paul said on other forums, if not this one, that the pre-release units had no such defect, thus any testing would not have caught the issue. Thus, any such criticism or accusation is not warranted. Maybe you didn't see that, but trust me it exists.

The warranty extension is Uniden's way of compensating for the inconvenience of having to return a unit, and is not a bonus as you imply it is. I wish the world worked that way, as its not fair that "those in successful monetary legal cases receive compensation, but I don't" sounds like a great way to get something for nothing - much like an extended warranty for all would be. I agree Paul needs to be careful how he answers so as to not risk Uniden's position, but I personally don't care for your cautionary warning, as it comes off as a threat.

As for the failure to support an advertised feature, what evidence do you have that Uniden does not intend to release that feature? It was stated publicly that a few features would not be available at release, and that was prior to the first sale. Apparently, you did miss that. But that is something that has been discussed on this list several times, as has the promise that it will be forthcoming - a fact which you even cited.

As for any Siren features on the iPad, nobody can answer because nobody has that feature yet. Please consider this an answer to that inquiry. I'm sure that was mentioned before, too.

As for "why 2 years", I can't answer why Uniden did that, but I am familiar with the legal theory of "delayed discovery" and its entirely possible that Uniden's lawyers advised to do that since there are many people who don't use the earphone jack, and may not have heard of the recall. Of course, I can foresee posts 3 years down the road from some upset person who just found out they have a defective unit. I'm sure they will claim they were never told of any warranty repair. ;->

BTW, if you really want the "compensation warranty", I'm sure you can find someone with an affected unit who would be willing to swap units with you. Of course, from what I've heard Uniden may know which units are affected and which ones aren't. That may or may not be true. I'm treating it as a plausible rumor.

Oh come on...

1. If your BCD536HP doesn't have the headphone problem then you have no injury and enjoy a great scanner with a 1 year warranty.

2. If your BCD536HP has the headphone problem, you're suffering injury from the day you open the box. When you send it back, you will have a delay in getting the replacement equal or greater to the time it takes to ship the replacement unit out to your location. You will be further inconvenienced by not having any scanner at all. So, out of the goodness of their hearts, Uniden has extended the 1 year warranty to 3 years.

I think that's quite fair. Your assertion that everybody should get that extended warranty is ludicrous. I suppose you think everyone who doesn't want to work for a living should be paid to sit at home and watch TV. Oh, wait - that's the Obama plan, isn't it? Nevermind.

Bob - KB1VUA

Joe. I checked my unit last night as the serial number is below so it would possible be affected. The audio is very low using the plug on the front panel. The headphones into the external speaker plug in the back was much louder
What should I be l looking for to see if I have a problem?

Hoping I don't

Joe,

Knock off the admonishments of my post. I posted what I know to be factual and wonder just who you think you are. Do you police this group as the administrator? Who are you? No one mentioned flaming except you. I stand by my post. Any criticisms I have stated are based upon what is known as common knowledge of the subject at hand. And ANY response from you or anyone else should have been made in a polite correction of the issues you found fault with. Your response does nothing but irritate the concerns I stated and by definition comes WAY closer to the definition of flaming than anything I wrote. So knock off the defensive righteous attitude and get back to what this group is all about.

The earphone jack would be low into an external speaker. Check the earphone jack with earphones and evaluate for excessive noise on the signals.

> First, I will remind you that flames aren't tolerated, and the quoted post is approaching the point that breeches that criteria. Please remember to keep your posts factual and not emotional. I see some of both in your post.
>
> That said, I know for a fact that Paul said on other forums, if not this one, that the pre-release units had no such defect, thus any testing would not have caught the issue. Thus, any such criticism or accusation is not warranted. Maybe you didn't see that, but trust me it exists.
>
> The warranty extension is Uniden's way of compensating for the inconvenience of having to return a unit, and is not a bonus as you imply it is. I wish the world worked that way, as its not fair that "those in successful monetary legal cases receive compensation, but I don't" sounds like a great way to get something for nothing - much like an extended warranty for all would be. I agree Paul needs to be careful how he answers so as to not risk Uniden's position, but I personally don't care for your cautionary warning, as it comes off as a threat.
>
> As for the failure to support an advertised feature, what evidence do you have that

Uniden does not intend to release that feature? It was stated publicly that a few features would not be available at release, and that was prior to the first sale. Apparently, you did miss that. But that is something that has been discussed on this list several times, as has the promise that it will be forthcoming - a fact which you even cited.
>
> As for any Siren features on the iPad, nobody can answer because nobody has that feature yet. Please consider this an answer to that inquiry. I'm sure that was mentioned before, too.
>
> As for "why 2 years", I can't answer why Uniden did that, but I am familiar with the legal theory of "delayed discovery" and its entirely possible that Uniden's lawyers advised to do that since there are many people who don't use the earphone jack, and may not have heard of the recall. Of course, I can foresee posts 3 years down the road from some upset person who just found out they have a defective unit. I'm sure they will claim they were never told of any warranty repair. ;->
>
> BTW, if you really want the "compensation warranty", I'm sure you can find someone with an affected unit who would be willing to swap units with you. Of course, from what I've heard Uniden may know which units are affected and which ones aren't. That may or may not be true. I'm treating it as a plausible rumor.

I think I'm probably on the same track as you, but just to be sure I want to confirm that it is the ***excessive noise*** from the headphone jack that signifies that the unit is affected? Based on Uniden's practice, I would expect the audio out of the headphone jack to be lower than the audio out of the external speaker jack by default. That is nothing more than Uniden's way of attempting to protect themselves from frivolous lawsuits (understandable).

Actually, it is our way of not blowing up peoples expensive (or cheap) earbuds or headphones (and perhaps driving their eardrum into their elbow along the way). Speaker level audio is way to much power for earbuds/headphones. You should never use the rear ext sp jack with headphones. It is properly driven for an external speaker.

The noise is only present on the headphone jack and only along with other audio.

Thanks Paul,

So far, I've seen only those points of my post that were in error corrected. For that I thank you. Going forward, I would appreciate it if my question about using an ipad mini to enlarge my display in my mobile application could be addressed, and an update as to where we are with the Siren App. (Driving to Fl from Ct next week and hoped to have the ipad mini larger display for the trip).

Paul,

Wait... I am penalized for NOT having a defective unit? Are you saying the warranty is extended an additional 2 years and covers the entire radio? Or just the headphone problem? Careful how you answer now... The answer won't go over very well with me if I find I loose out on an extended warranty. Especially when added to the failure to support an advertised feature (I saw nothing in parenthesis stating "coming soon" but I may have missed something.) And if any of those so-called "Alpha" testers had a defective radio and missed something as basic as checking to see if headphones work correctly it's time to question your loyalty to them. They simply ain't getting it done. But that siren app works me to no end. And asking for help only twice, no wanting to make a pain out of myself, on my attempt to use an ipad mini to simply enlarge the display for my vehicle application have no responses as yet. I have no problem with the correction procedure-I just relate it to a vehicle recall-bring it in and we will fix it for free. But extend the warranty? By 2

years? You are going to have corrected the bad stock in 6 months to a year. So why 2 years? Should we be thinking what else is wrong? Siren app beta was hinted about for this week but again, I'm still waiting. Tell me I missed that something too?

Trusting Uniden but faith is being tested.

On Feb 26, 2014, at 4:24 PM, Uniden UPMan <uniden.upman@...> wrote:

Thank you for being patient while we set up our BCD536HP Headphone Campaign. To take advantage of the headphone campaign, proceed to the following link:
http://repair.uniden.com/rma.cfm
There, you will enter your scanner information. Once we receive that information, we will reserve a return unit for you and send you a link to put in your shipping address. This link will allow you to print the UPS prepaid shipping label to send your scanner(s) back to us. If we do not have inventory ready, we will send you an email to let you know this…just keep using your scanner until you get another email from us that has the UPS link.
Once we get confirmation from UPS that they have received your package, we will immediately ship a replacement scanner back to you. The scanner we send to you will either be one that has been returned from one of our distributors or from a previous return. In either case, it will be screened at every step of the rework process for any physical or other damage or defect and will be rejected from the program if anything is not perfect.
We are confident enough in our rework and screening process that we are extending our normal 1-year warranty to 3 years for all scanners subject to this campaign.
We expect that most people who use this program will have a replacement scanner in their hands within 1-4 days of when UPS receives their scanner for shipment to us.
Some very important notes:
Do not send any accessories other than the MicroSD card back with your scanner. The scanner we are shipping to you will have only the MicroSD card (installed) and no other accessories. If you do send some or all of your accessories, it could take several weeks for us to find them and send them back to you.
Send your scanner back within 5 days of filling out the UPS form. After 5 days, we will remove the reservation from the units we set aside for you and use them to fulfill other requests. Your replacement units will then ship subject to availability once we receive the UPS shipping notification.
If you are a dealer returning unopened inventory or a mix of opened and unopened, your instructions are slightly different. For unopened inventory, we will request only a count of how many units you are returning. You should keep these units unopened and return them to us under the program. Opened inventory should be treated as above, and returned with no accessories other than the MicroSD card.
If you want your original scanner returned to you, DO NOT USE THE ABOVE LINK. Instead, use our normal repair process. Instructions for using this process are at http://repair.uniden.com/repairInstruct.cfm. The repair process will take from 3-6 weeks, depending on the current workload when your scanner arrives.
This campaign only applies to BCD536HP scanners with a serial number ending in 2600 or lower, and which exhibit the problem of a high level of noise when using headphones. Do not return your scanner if it does not have the problem.

Actually, it is our way of not blowing up peoples expensive (or cheap) earbuds or headphones (and perhaps driving their eardrum into their elbow along the way). Speaker level audio is way to much power for earbuds/headphones. You should never use the rear ext sp jack with headphones. It is properly driven for an external speaker.

The noise is only present on the headphone jack and only along with other audio.

Subject: Re: [BCD536HP] BCD536HP Headphone Campaign

I think I'm probably on the same track as you, but just to be sure I want to confirm that it is the ***excessive noise*** from the headphone jack that signifies that the unit is affected? Based on Uniden's practice, I would expect the audio out of the headphone jack to be lower than the audio out of the external speaker jack by default. That is nothing more than Uniden's way of attempting to protect themselves from frivolous lawsuits (understandable).

On Thu, Feb 27, 2014 at 8:19 AM, MCH <mch@nb.net> wrote:

The earphone jack would be low into an external speaker. Check the earphone
 jack with earphones and evaluate for excessive noise on the signals.

Topic: 538 Message: 539

We'll process all return requests within 1 business day. Typically, all requests sent will be processed before noon the day after the request is submitted.

This morning we processed 30 requests and are waiting for some positive feedback on those before processing the rest, so the bulk of the requests we've received so far will be processed this afternoon. This also means that if you send a request before about noon, today, it will actually be handled today.

540. Box To Ship The Defective Radio Back

Yahoo group: BCD536HP
Date: 2014-02-27 15:23:27 UTC
From: <kstrsdn@...>
Topic: 540 Message: 540

I do understand that the radio is to be returned without accessories but do you return the radio in the original box the radio came in from the factory or do you send it back in any box?

Thanks,
Dean

You can use whatever box you want (we do want it to be properly packed to ensure no shipping damage, though). The unit we are sending to you will be in a brown box.

544. Additional Shipping Question For Headphone Campaign Defective Scanner

Yahoo group: BCD536HP
Date: 2014-02-27 15:41:24 UTC
From: <kstrsdn@...>
Topic: 544 Message: 544

Is there any documentation or note that needs to be included in the box with the defective scanner? If not, I would like to get it boxed up in anticipation of receiving the shipping label.

Thanks,
Dean

545. Re: [BCD536HP] Additional Shipping Question For Headphone Campaign Defective Scanner

Yahoo group: BCD536HP
Date: 2014-02-27 15:45:29 UTC
From: Uniden UPMan
Topic: 544 Message: 545

If you know that there is some other issue with the scanner, a note would be appreciated.

Otherwise, no note needed (the shipping label will have a reference # that will match your return to what you reported to us).

So far, we have plenty of units to handle all requests received, otherwise I'd recommend you wait for the UPS email. You are pretty safe, though.

From: Steve Smith
Topic: 544 Message: 547

Earlier today I filled out and submitted the online form and I received an email from Uniden that said: "We will send a return shipping label to the email address you entered." However, I have yet to receive the shipping label. Is there a delay in getting the label? Perhaps Uniden has to confirm the serial number? Or, perhaps my email from Uniden got intercepted by a spam filter or was otherwise lost in cyber space. I hope to get the shipping label soon because I have already packed up the scanner.

548. RE: [BCD536HP] BCD536HP Headphone Campaign

From: Russell Adams
Topic: 514 Message: 548

This is probably a major reason Uniden does not announce products or features in advance of actual release. After such an announcement, Uniden (and Paul) catch flak no matter what is announced until it is released. Then once released, Uniden catches more flak because the release isn't exactly what the user thought it was going to be or how it works. Damned if you do and damned if you don't.

The way these scanners are designed they are easily updated to upgrade existing features and functionality, as well as, a huge potential for new features and capabilities. I am excited to such a scanner on the market and thrilled with what I have. Be patient, we are only beginning to tap what these scanners can do.

3. If you are a dealer returning unopened inventory or a mix of opened and unopened, your instructions are slightly different. For unopened inventory, we will request only a count of how many units you are returning. You should keep these units unopened and return them to us under the program. Opened inventory should be treated as above, and returned with no accessories other than the MicroSD card.

4. If you want your original scanner returned to you, DO NOT USE THE ABOVE LINK. Instead, use our normal repair process. Instructions for using this process are at http://repair.uniden.com/repairInstruct.cfm. The repair process will take from 3-6 weeks, depending on the current workload when your scanner arrives.

5. This campaign only applies to BCD536HP scanners with a serial number ending in 2600 or lower, and which exhibit the problem of a high level of noise when using headphones. Do not return your scanner if it does not have the problem.

Yesterday, Paul said that requests are typically processed around noon. (TX time)

Was your request made before that? I would think waiting 24 hours would be warranted.

My request was made around 5:30 AM EST yesterday (2/27/14) and have not received an e-mail yet with the UPS label. I did receive an e-mail confirmation with a reference number immediately but after that, nothing.

I believe the shipping label is sent from UPS and not Uniden from the way Paul stated it. So it has to go through Uniden then to UPS then to you. Who knows how long it will take UPS to get them into their system and sent out.

48 hours or so. My initial reply from Uniden was that my reference number is 49 so if the number of requests has grown significantly it may take some time for their staff to process all of requests into their system and UPS account. Once entered I'm guessing UPS "automagically" sends out the information via email for the scanner owner to enter shipping information.

On a personal recommendation, please carefully read the instructions on what to include in your return shipment (e.g. INCLUDE the SD card) that you received from Uniden. I didn't and will probably experience a delay in processing. I'm awaiting a reply from Uniden on how to proceed since I messed up on that point.

They have your email address which is how you get the shipping label that you print and put on the box to send to Uniden.

559. ICALL Question

Yahoo group: BCD536HP
Date: 2014-02-28 13:40:29 UTC
From: James F. Boehner MD
Topic: 559 Message: 559

I had a question about ICALLs but did not see an answer.

I noted that a “.0” was a wildcard character to use for ICALLS when in scan (not search) mode. I have been monitoring and recording TG’s on my BCD996XT which is in SEARCH mode, and have not received any ICALLS.

My BCD536HP is not finding ICALLs either.

Paul, did Uniden remove the feature to receive ICALLS, or am I missing something?

I remember receiving them up to the last firmware upgrade on my BCD996XT. I remember turning them on in the menu was a possibility at one time.

So, how do I set the scanner(s) to receive ICALLs?

’73 de JIM N2ZZ

A human will review all opened cases every morning and assign inventory to each case (up to the point where we run out of inventory). If inventory is assigned to you, you'll get an email with a UPS link. If we don't have inventory, we'll email you that information and once we get more inventory we'll send you the UPS link.

Won't delay you getting a replacement (they won't notice until they get it and start checking). Will just be a small cost add to our process. Don't worry too much about it.

Hi Paul,

So I haven't e-mailed you directly, but I don't see a answer, so here goes: WHat's the proper way to report what may be a bug in the software / firmware?

I posted a few things I believe to be bugs - a few software (Sentinel) and a few firmware bugs. I even posted "ATTN PAUL" - and no response. People confirmed what I was seeing as being the case, so it isn't a 'one user error'.

What's the proper way to report these? Would just like to see a reply along the lines of "This isn't a bug, it's doing that because...." or "Oh, we'll look into fixing that in a newer release" or "Sorry, not much we can do about that because..."

Thanks :)

Report them in public forums. You won't typically see any response from me, as I do not comment on these issues until they have been duplicated and we have made an action plan, have tested a fix, and are about to release a fix.

Oh - ok. Would be nice to see something along the lines of "Noted" or just something so I know it's at least been seen (I don't expect you to read / see every e-mail), so I can at least know it's been seen :)

Thanks for all your hard work :)

I keep a private Google drive sheet that I share w/Engineering that lists problems that have been reported along w/links to the report.

Actually, if someone wanted to make/maintain a public version, I'd probably refer to that, as well (but know that it will have many "bugs" on it that are just people not understanding how radio systems or the scanners work).

Thank you sir. I was thinking I could preserve all my previous programming efforts by keeping the SD (trying to make my life easier as my leaning curve has been steep).

Thanks for all of the work you do for this group and the end users.

George Bittles

You can do that two other ways:

1. Read the scanner into Sentinel

2. Make a folder on your PC and copy the contents of the SD card.

That is correct. We have not released an update for the BCD436HP at this time, but expect to release one next week, assuming final testing doesn't uncover any gremlins.

From: Evan Platt
Topic: 568 Message: 577

I'd be willing to look into a google folder.

But my point was more along the line of some sort of acknowledgement.

Say I post a 'bug' (or what I think Is a bug.) You simply say "acknowledged." I at least know you've seen it. Sure, maybe it's user error, but you've acknowledged you've seen it.

Right now, with no acknowledgement, I have no idea if my bug report was even seen. So say you didn't see my bug query. Now 2 years from now, I'm like "Ok, this is a pretty serious bug, why hasn't Uniden fixed it"? So I ask again. Oh, oops, you didn't see the message, so it never made it past my outbox to anyone at Uniden.

If it's at least acknowledged, I at least know that if it IS a bug, there's a chance it will make it to some future release.

Hopefully this makes sense.

578. Replacement BCD-536HP Tracking Number

Yahoo group: BCD536HP
Date: 2014-02-28 20:19:28 UTC
From: <kstrsdn@...>
Topic: 578 Message: 578

I have 2 questions:
1) how soon after UPS receives my scanner will Uniden send out the replacement?
2) will we receive a tracking number via e-mail once the replacement scanner has been sent?

Thanks,
Dean

579. Re: [BCD536HP] Replacement BCD-536HP Tracking Number

Yahoo group: BCD536HP
Date: 2014-02-28 20:26:10 UTC
From: Uniden UPMan
Topic: 578 Message: 579

It can take UPS's system several hours to update the status on their tracking page. We don't monitor the page continuously...only a few times per day in between doing many other things involved in the campaign. So, it could take a full business day for us to get the link then update your record and send out the replacement unit.

You will receive a link to our SRO system that will show the tracking number once we ship. However, the SRO system takes 24 hours between when we create a record and when the link page is live (one of the many reasons I hate that system but am stuck with it for now).

From: <qp2trz@...>
Topic: 580 Message: 580

Greetings Everyone!

When inspecting the settings of the radio using the Sentinel software,
I cannot change the Ontario Fleetnet Network from Scan to Search.
When I click on the setting it opens the selection and displays the talkgroup names.
Any ideas?

Regards<

Joseph

582. Headphone Campaign Status Update

Yahoo group: BCD536HP
Date: 2014-02-28 23:22:30 UTC
From: Uniden UPMan
Topic: 582 Message: 582

At this time, all submissions have been processed and you should have received a link that gets you to the UPS label page.

We have also processed about a dozen return shipments. These are handled through something called our SRO system. A process runs every night that creates a customer SRO page and sends an email with a link to that page. Your UPS tracking number for the unit coming back to you will be on that SRO page.

Our distribution facility closes at 3:30 pm, so shipments to us that showed up in the UPS tracking system after that time will be handled on Monday. (To be fair, they also get to work at 6:30 AM, so don't be too hard on them for leaving as early as they do.)

It looks like we only have one form being filled out but not submitted, yet. That one and all others submitted over the weekend will be handled on Monday. Thank you all again for your patience, and I really, really, wish that this entire campaign had not been necessary.

And keep in mind that whether the unit is one that had the part change or not they are still NEW. The only reason they are considered "refurbs" is because the factory substituted a part that was out of spec and the fix replaced that part with one of the proper spec. So its still a new unit either way.

While I think Uniden is doing their SINCERE BEST to properly handle this matter, I would argue with your definition of "new". Like the car analogy, the scanners really are "pre-owned". They were sold by Uniden, and the person getting it back after the repair more than likely is not the original owner. However as stated, I still think Uniden is doing their best to make it right.

585. Buying an "upgraded" 536

Yahoo group: BCD536HP
Date: 2014-03-01 03:06:47 UTC
From: <wcorea@...>
Topic: 585 Message: 585

I'm planning on buying a 536 in the next month or two. There seem to be a flurry of fixes, which appear as firmware updates. If I don't want to hassle with downloading and installing firmware, at what point (or maybe what serial number) can I expect to get an upgraded-firmware version of the radio? Do any of the companies that sell them install the firmware upgrades?

As was stated before, you have the option of replacement of the part and return of your unit to you under the normal repair program in which case you would get your unit back.

It's really not a hassle. Once you connect your scanner to the PC running Sentinel, its literally a matter of two mouse clicks to update the firmware. Updating the database is more involved.

I didn't get the response quoted below but....
Actually if you read what was written by Paul they had units that were not yet sold, both I'm hand and at dealers. Those units were/are many of those that would be repaired and then used to fulfill the replacements. So yes, many, especially those done early in the process would probably be units never used. And even if they had been they probably weren't used hard since they are basically less than a month old anyway.
And as for what they are doing to make it right, yes, they are doing an excellent job, and have gone far and above what any other company would. Most companies would just say " too bad, we don't care" but instead, Uniden adds two years to the warranty! Why? Why would Paul spend so much time helping users on the forums? Both are the same answer, because Paul cares about the customer and the product! And so dose the whole Uniden company.

Unfortunately I don't use a PC, I have a Macintosh, so a "PC running Sentinel" is not an option. Is there a Mac version?

If you don't already know it - this is NOT your grandfather's scanner. It has a database that must be updated using a PC application called Sentinel. It only runs on PCs or macs running Windows emulation software.

You WILL need to update the channels at some time and cannot update the main database without running Sentinel. You are expected to be able to do this yourself. If this scares you off, you may not want this particular scanner as it's more of the iPod generation than you, apparently, are.

This question comes up all the time on various forums. I wrote an article for ScannerMaster all about using Macs for scanners. You can read it at: http://www.scannermaster.com/Mac_Users_of_Police_Scanner_Radios_s/575.htm

The upshot is that there is no Mac version of Sentinel but you can run the Windows program on the Mac, albeit with a little effort.

Enjoy!

Bob:

I know a lot about the 536. I've even touched one at HRO. I just feel that if it's supposed to be a "simple" device, it needn't be "high maintenance". Why not have it use WiFi to automatically download database updates ("What a concept!") instead of burdening the owner with all the rigamarole of running a separate program to do it? After all, my Macs download and install updates all by themselves (and I hear some PCs can do that. too).

I suspect the scanner does not have the horsepower to do that. After download, the data must be formatted for the scanner. It takes a decent PC about 30 seconds to do that I would hate to think how long it would take a scanner that runs at a fraction of the speed.

Besides, many people like myself don't use the preprogrammed database, so a separate program is the most efficient way to program the unit.

Has anyone received a tracking number yet for the replacement radio? I understood that we would have a replacement radio 1-4 days after the defective radio was in the hands of UPS.so I would think these replacements should be already sent out.

Dean

I sent in my request last Thursday evening. I receive my request number for Uniden early Friday morning, UPS email with link for shipping label link late Friday afternoon. Shipped package after 12:00 PM Monday, received email from Uniden Tuesday afternoon with UPS tracking. Replacement scanner due for delivery Friday afternoon this week. Total Tim without scanner 4.5 days. Absolutely no complaints from me, I think Uniden did a fantastic job on the whole process. Bruce KG6JIY

603. Headphone Return Process Modification

Yahoo group: BCD536HP
Date: 2014-03-06 00:57:05 UTC
From: Uniden UPMan
Topic: 603 Message: 603

ALL:
Well, you guys were a lot more interested in this than we had initial inventory capacity to cover. So, we'd like to change things a bit (I think if you consider the alternative of restarting in April, you'll agree that the change is better than the wait).

Continue to submit your requests through the link I provided. We will submit your scanner to the repair department the day it arrives and return it to you as soon as repair is finished. Our goal is to ship your scanner to you within 3 days of receipt, but I really expect most units to go out the same day we receive it...but it will ultimately depend on how many we get on any particular day. We may be able to resume the faster service in April, but by then I really expect most of this to be behind us.

If you've already submitted your unit and have received a UPS label link, we have just enough inventory to cover those with the fast ship method…we're not going to pull a switcheroo on you after you've sent your scanner to us.

If you haven't received a UPS label from us, I'll contact you tomorrow afternoon with some options. Will be at the repair center tomorrow morning helping evaluate and adjust the process.

OMG. This group has degenerated into a group of old cantankerous women. I can't believe all the messages and posts about this process of returning units, getting them repaired and returned. Do you really think everyone has to post the minute by minute reports on who got a return label, who is still waiting and when who received what and when and general cackling, rehashing, and muttering over this process. I don't care when you put your package in the process. You probably check the shipping tracking updates every ten minutes. It is like watching paint dry.

I am certain that Uniden will do every thing possible as quickly as possible. Can we please stop this avalanche of minutia email postings.

Sincerely,

Gary Webbenhurst

Looks like Paul has adjusted [getting swamped] with the new turnaround expectations. As for the "blow by blow" description of the first return process, yea, a bit much. I expected the usual excited posting when the radio showed up on the doorsteps ("I got mine today! Yea!") but I was about to stop watching the list until this headphone thing died down. Now, about that Siren App... Paul tickled us with his comment about him seeing the beta and liking it. That was all I could take. The saliva started, my wife asked if I had suffered a stroke, what with all the drooling going on... You know the rest. I guess Paul asked Engineering if they could post the beta, but nothing yet. And I'm running out of spit!

Gary,
People are concerned and want to be informative. There is nothing wrong with that and frankly this one of the reason these groups exist. Additionally, that is also why we have VFO knobs, volume controls and on/off switches on our ham radios.

Topic: 610 Message: 610

I know I am beating a dead horse, but I need clarification on the charging time for the clock. Does the scanner physically have to be on for 50 hours to completely charge the power source for the clock or doe it just need to have power going to the unit for 50 hours? Thanks in advance.

Dean

No, but over night should do fine.

Are you sure the scanner doesn't need to be on? I plugged myne in easily 24 hours and it didn't store the date / time (it was off). Once I left it on for 24 hours, it was then fine.

The bottom line is that the scanner must actually be turned on to charge the clock battery. I plugged in and ran the scanner for a quick ~half hour, but had to leave. Left the scanner plugged in from the time I came back home, all night, and the next day while at work. Came back home and had to set the clock. So just being plugged in was not enough for me.

This brings up a very interesting finding (at least for me). Out of curiosity generated by this question, I went into the menu and changed my “Daylight Saving Time” setting from OFF to ON, yet the clock DID NOT change. I set it back, and once again, the clock did not change. Since the “Set Daylight Saving” doesn’t change the clock, I wonder what its purpose is?

That's because you didn't wait for a time change to occur. Turn it ON,
and watch it at 2AM Sunday morning and you will see it change.

My understanding - the way most devices operate - is whether or not you 'observe' daylight savings. Some cities / states don't observe Daylight savings. If you live in one of those places, turn it off.

Joe, I think you're being serious?

With Windows, it asks you if you want the RTC to automagically change with "Saving" time, the x36 asks you to enter if it is/not "Saving" time. So going on what you're saying, when I look at the x36 on Sunday morning, not only will the RTC reflect the change, but the answer to the "Saving" time setting will also reflect the change. Now that's just hard for me to believe, I'm getting ready to find out now by setting my 436's RTC to something like 1:55 Sunday morning, and just watch…

You had Daylight Savings Time On?

Perhaps some other condition needs to be met - a power cycle or something?

Not sure how the x36 operates. I don't generally stay up to watch a device spring ahead or fall back.

>With Windows, it asks you if you want the RTC to automagically change with "Saving" time, the x36 asks you to enter if it is/not "Saving" time. So going on what you're saying, when I look at the x36 on Sunday morning, not only will the RTC reflect the change, but the answer to the "Saving" time setting will also reflect the change. Now that's just hard for me to believe, I'm getting ready to find out now by setting my 436's RTC to something like 1:55 Sunday morning, and just watch…

>With Windows, it asks you if you want the RTC to automagically change with “Saving” time, the x36 asks you to enter if it is/not “Saving” time. So going on what you’re saying, when I look at the x36 on Sunday morning, not only will the RTC reflect the change, but the answer to the “Saving” time setting will also reflect the change. Now that’s just hard for me to believe, I’m getting ready to find out now by setting my 436’s RTC to something like 1:55 Sunday morning, and just watch…

You must have missed my "Light bulb moment" reply. Setting Daylight Saving Time did it, and I actually watched the RTC hit 2:00 am, then jump to 3:00 am when I changed it to 1:57 am on 3/9.

Thanks again,
Dewey

You had Daylight Savings Time On?

Perhaps some other condition needs to be met - a power cycle or something?

Not sure how the x36 operates. I don't generally stay up to watch a device spring ahead or fall back.

First I'm going to admit that I haven't been following this thread very closely, but I have a question that may have already been covered. I've owned scanners since the 70's and I've never had one with a clock. My question is: other than telling me what time it is, is there another function for the clock on the 536?

Ed

Off the subject, but question related. you don't remember the old Regency HX-1000. An '80s scanner that really looked like a hand held radio, compete with a "push to talk" button that would display the clock :-) ?

Yep. The portable used two-way portable parts and the mobile used mobile two-way parts.

They had pretty good frequency coverage, too.

From: <kstrsdn@...>
Topic: 637 Message: 637

I received my refurbished BCD-536HP last Friday, 1 week to the day from sending it in which was very impressive. I noticed immediately after I turned the refurbished unit on that there was an audible noise with and without stations transmitting, similar to the noise that a computer hard drive makes when it is reading / writing. The noise does not increase in amplitude when the volume is increased and can be heard at the same level when the volume is set to zero. This noise at times will not stop until I turn the radio off. The unit I sent back did not exhibit this noise problem and I am now sorry I did not keep it. I would of rather had the headphone jack issue than this noise issue. I am very disappointed to say the least. I paid $600 for a new unit which I only had for a couple of weeks and got a refurbished unit back with a different issue.
I really don't want to call tech support and have them tell me this is normal. I would greatly appreciate it if UPMan would help me get this resolved.
My Yahoo e-mail is kstrsdn@yahoo.com..

Regards,
Dean

You may not get in touch with Paul (UPMan) directly because he's the product manager for Uniden scanners. He's busy and doesn't have time to answer every question.

The correct way to deal with this problem is to call Uniden tech support and tell them what happened. I'm sure Paul will hear about it but he's not the guy you want to contact. Tech support is 800-297-1023

Follow the prompts (1 for English etc.) until your product type is listed. Wait for a customer service representative and explain your problem. Have your serial number available. This is the only way to assure you will get the service you require. Email is NOT the best way - period.

Bob in MA

Under the circumstance, I feel Paul is exactly the right person to talk to. I received my refurbished unit with another problem. Paul is the one who headed up the headphone jack campaign and this is related because my replacement for the original headphone jack problem now has a different problem. If I call tech support, I will most likely get that is normal, or send it in and wait 6 weeks which would be ridiculous. If I would of had the new problem only, I could have exchanged it for another new one from where I bought it immediately. I have seen responses from Paul on other issues, just not this one.

It all depends on the system. If you have multiple sites, assign each a Site Quick Key and disable any sites not near you. There may be other solutions, but knowing which systems and system types would help steer toward better answers.

From: Evan Platt
Topic: 654 Message: 654

Is there a way to exclude JUST FM Broadcast from CC? I see for exclusions 54-108. FM Broadcast is - what 88.1 - 108? Not sure what's on 54-88, but ideally I'd like to include 54-88 but exclude 88.1 - 108. I get hits on almost every FM station :)

Thanks.

54-72 - TV Broadcast
72-76 - misc utility band
76-88 - TV Broadcast
88-108 FM Broadcast

You could enable the stock screen then make a custom screen for just 88-108 MHz.

Ahh, thanks. I thought there was something else on 54-88. So I'm OK blocking all that :)

Maybe I'll try the custom too.

Thanks :)

Paul (UPMan) said that all 'in stock' units were requested to be returned, so you should be good.
I would specifically ask the vendor.

Bill,

Per Upman, all units with a serial number of 38002600 or below are being recalled. The problem does not affect any units above 38002600.

667. USB Port for Serial (The Last Word...for now)

Yahoo group: BCD536HP
Date: 2014-03-18 14:36:21 UTC
From: Uniden UPMan
Topic: 667 Message: 667

There are a couple of inherent problems with using the USB port for a constant serial connection, under the current operation. At this time, we really recommend you use the actual serial ports. For the 536, serial commands work through the 9-pin RS232 (GPS) port, as well as through the USB port in serial mode. For the 436, serial commands can be sent through its GPS port, as well (using the same cables as used with the BCD396XT). The advantage of this over the USB port is that the USB port is currently set to go directly to Mass Storage mode if it is connected when the scanner reboots (as could happen either when the scanner loses power momentarily or if there is some memory fault that causes a reboot).

Is Paul's post in response to a thread? It appears to me that he is answering a question but it may be informational only in nature... If he is answering someone's question, what was the question? What would someone be trying to accomplish doing what Paul describes? I am not computer tech savvy and the referrals to serial ports and USB leave me lost. Does this have something to do with the Siren app that hasn't appeared yet?

671. Unitrunker and PRO96COM with the BCD 536HP

675. Spelling error in firmware updated for BCD536HP??????

Yahoo group: BCD536HP
Date: 2014-03-26 13:12:22 UTC
From: Michael Lynch
Topic: 667 Message: 675

I just updated the firmware for my Uniden BCD536HP desktop scanner to firmware version 1.03.03.

Has anyone else noticed that now when you power up the screen reads Uniden "Barecat" instead of "Bearcat"?

It was correctly spelled when I received the scanner with the original firmware installed.

681. I wish I could talk to someone who knows how to program using Sentinal

Yahoo group: BCD536HP
Date: 2014-04-06 14:52:31 UTC
From: <genelp@...>
Topic: 681 Message: 681

HI, I have been trying to figure out how to program my new BCD536 using Sentinel and I am having so much trouble trying to get or understand the culture of the product. I have a lot of questions, but too much to write about on this forum. I watched all the available YouTubes and yet I'm still having problems. I wanted to program a favorites list for my local USCG whose P25 frequencies do not seem to be in the database. I have the frequencies so I watched each YouTube tutorial but when I get to input a channel there is no place to put a frequency in...ARRRGH. I love this stuff and this radio, but I just don't have the attention span or time frame to keep trying to figure it out. Would someone be willing to have a phone/Skype/text chat with me? I'm sure it is simple enough but I need someone to help me through the process. My email is genelp@gmail.com.
I have more questions, but maybe I can get some help over the phone. I would really appreciate it. Thank you. Gene

What steps did you take to create the new FL? You were likely
only a step or two away from where you wanted to be.

> HI, I have been trying to figure out how to program my new BCD536 using Sentinel and I am having so much trouble trying to get or understand the culture of the product. I have a lot of questions, but too much to write about on this forum. I watched all the available YouTubes and yet I'm still having problems. I wanted to program a favorites list for my local USCG whose P25 frequencies do not seem to be in the database. I have the frequencies so I watched each YouTube tutorial but when I get to input a channel there is no place to put a frequency in...ARRRGH. I love this stuff and this radio, but I just don't have the attention span or time frame to keep trying to figure it out. Would someone be willing to have a phone/Skype/text chat with me? I'm sure it is simple enough but I need someone to help me through the process. My email is genelp@.... < /p>

From: Jim Segars
Topic: 683 Message: 683

Hi everyone,

I'm considering the purchase of a 536HP. I'm confused about the *remote control* aspect. Is this whats referred to as the Siren feature? If so, is this feature available, abandoned, due when?, or what. My confusion is not cleared up by Scannermasters description of *Whats in the box* NOT including the WiFi dongle.
Unconfusing the issue would be appreciated!

Thanks,

Jim

The dongle is included. Yes, SIREN is the remote control app and its not yet available, but should be soon - perhaps this month.

I created a new fav list called USCG. I highlighted the new list; added new departments, I.e. Boston Sector, etc. I highlighted one of the departments and added some new channels for each. For the US Coast Guard, I am using the Service type: Military. I click options and all other accesses, but nowhere in this case am I able to enter any VHF Frequency. I notice that when I follow UpMan's YouTube and highlight an existing element in the US database, all the info gets included in the favorite list. But when I want to add my own data, I am not able to include the frequency. Can you help? I would appreciate a phone call, however. It takes me too much time to write out an explanation without making a lot of mistakes. Thanks Gene

It sounds like you missed the part where you added a new System. You had to have done it or you wouldn't have been able to add a new Department. Anyway, you need to make sure the System you add is a Conventional type.

For clarification . this is not in the firmware. This is set via Sentinel. Edit -> Edit Profile -> Display Options. This is part of the Opening Message.

Well - Without knowing how the firmware on the 396 works - it's entirely possible it works like this (and it's just a guess)...

Firmware - this is the 'entire' scanner. It's very likely this opening message is in the firmware - and yes, can be changed via the Sentinel software. Since the firmware likely needs to contain *everything* in the scanner - including the login message. So what happened to me also hapened to the OP - the firmware upgrade overwrote what was in Sentinel.

Never mind the Japanese engineers... I was ready to blame the same bunch that can't seem to get a handle on the Siren app... When I saw the miss-spell I lost a little more faith in the UNIDEN Team. I figured if they can't get their employers name right how can we expect them to produce an app for WiFi...

692. Communications Electronics Inc

Yahoo group: BCD536HP
Date: 2014-04-11 02:43:45 UTC
From: Jim Walls
Topic: 692 Message: 692

Does anyone know if Communications Electronics Inc
(http://www.usascan.com/) is still in business? For years I have bought
scanners from them and recommended them to others. However I note that
their website has not been updated in a long time. Makes me wonder if
they are still around. If they are gone, how about some recommendations
for a good vendor. My tax refunds came so time has come to place an
order for a 536.

Site hasn't been updated since 2006 so they must not be in business now.
Ham Station in Southern Indiana is one place. Scanner Master is another and the Bearcat Wearhouse or Universal Radio is another. All have different shipping options but price is fairly close so do some studying on each.

Scanner Master told me that the owner became very ill and could not continue running the business, and nobody else wanted to. From what I gather, there is not a lot of money to be made selling scanners and/or ham gear. So no one stepped up to the plate. As for surplus inventory, I wonder if there ever was any... Maybe CE just ordered up what was needed when they received an order from a customer...

It's been a couple of years (and I've changed the opening screen graphic) but I believe the HomePatrol-1 had the same spelling error. I assume it's a problem left-over from when the graphic artist created the opening screen. Since it's not "text", spell-checkers didn't catch it I assume. Apparently the HomePatrol opening screen graphics were converted to dithered B/W for the BCD 436/536hp and the problem now lives on... Oh well.

Yes, they are still around. They just did not adjust the dates on the web page. They have the 536 in stock but are sold out of the 436 at this time.

Well, at least I'm glad to hear that they didn't become seriously sick, however, something has changed! They were my definite go-to in the early 2000's, but their level of service with me bottomed out 2-3 years ago when I bought my second HomePatrol. I attempted to talk with them concerning the problem since it wasn't their style up to that point, but they didn't seem to give a hoot. At this point, if Ham Station has it, that's where I'm buyin'!

Yes, they are still around. They just did not adjust the dates on the web page. They have the 536 in stock but are sold out of the 436 at this time.

On Thu, Apr 10, 2014 at 9:43 PM, Jim Walls <jim@...> wrote:
Does anyone know if Communications Electronics Inc (http://www.usascan.com/) is still in business? For years I have bought scanners from them and recommended them to others. However I note that their website has not been updated in a long time. Makes me wonder if they are still around. If they are gone, how about some recommendations for a good vendor. My tax refunds came so time has come to place an order for a 536.

I see the page now looks current... Guess they updated it since the last time I visited around the first of this year.

Well I just called CEI and they answered and said they had the 536 in stock
and ready to ship. The website has the XT series so it isn't THAT old...

While I prefer ScannerMaster for many reasons it appears these guys are
still around.

I bought my 536 at Ham Radio Outlet (the Salem, NH store).

Communications Electronics website show a last update of 2010. I'd say they're dead, but I really have no other evidence.

Rich Carlson said (in part):
> The website has the XT series so it isn't THAT old...

The XT series is not exactly new, and the main page shows a 396T and 996T as new products and that's the page people are going to see.

I'm very happy with my 396XT and 996T, but my local electric utility (who I used to work for) is going P-25 Phase 2 later this year and I like to listen to them. I will likely eventually get both a 536 and 436, but I'll start out with the 536 and make heavy use of the Android app (when it comes out)...

I was out of town for a week and turned off the scanner, but did not unplug. When I returned home and turned it on, I got an error message saying "City data table read error Please check citytable_V1_00_00.dat in sd card" I turned off scanner and tried again, no go. Went to software and reloaded, still no go???? Thanks for any ideas.....Bill

What state do you live in? Can you read te card with Sentinel? Do you
have an adapter so you can read the card directly (without the scanner)?

If I'm not mistaken you did have some thunderstorms within the past week or so.

Did you try the option in Sentinel to clear the user data?

Or does the PC not see the card as a drive at all? (Can you see it in Explorer?)

Greetings Everyone!

Has anyone switched their ID Scan to ID Search successfully
With GPS running and a range of twenty miles, I have not been able to change any of the database groups to ID search from ID scan.
Is ID Scan locked once talkgroups are programmed in to the systems

Regards,

Joey VA3GOC

After doing a bit of reading, it seems that you need to use Discovery to find any individual IDs or Talk Groups not programmed into your Favorites List. I tried that with a couple of my programmed in trunk systems and that's how it worked.

Thank you all for your replies.

Looks like I can only use ID SEARCH with the groups that are in my favourites list.
Does this sound right
If I am visiting say the sunny south and don`t know my Kissimmee from my Disney and totally rely on GPS,
I cannot switch to ID SEARCH unless I move these groups enabled due to location to the favourites list.

Thanks again, got more learnin`to do,

Joey

Individual ID search or Talk Groups? And how do you do it? Actually I'm
not as much interested in individual IDs as I am in finding TGs for a
new 700 system that is still being developed.

Not sure what an individual ID search would be. I usually set it in the settings in the scanner or Sentinel, but there is a keyboard shortcut that will toggle it. Function enter maybe? I forget.

Individual ID would be unit or subscriber ID on a trunked system. As
opposed to the Talk Group ID.

Ok. Unit ID as it's usually called. You can turn UIDS on or off. If it's on,
any unknown (untagged) IDs will simply show as a decimal ID.

If it's off, no UIDs will show.

Subscriber is the technical term for individual users.

That aside, what we were discussing is if you can search for unknown Talk Groups while scanning in a Favorites List or if you need to use Discovery. From reading the manual and trying it out, it appears to me that the scanner needs to be in Discovery mode. If not, how do you change trunk system in a FL from TG Scan to TG Search?

Yes, I know subscriber units are what they are called in Motorola-eeze. In Uniden-eeze they are called Units. There are tons of terminology differences between Land Mobile and scanners.

Anyway, as I mentioned in my first reply, I use ID Search all the time. That is the mode that searches/receives unprogrammed/unknown TGs. As for how to set it, read the quote 4 below from 4/14/2014 17:57.

Joe M.

721. RE: [BCD536HP] ID Search vs ID Scan

Yahoo group: BCD536HP
Date: 2014-04-15 16:04:17 UTC
From: Russell Adams
Topic: 711 Message: 721

I do the same thing Joe does. Set ID Search on in my FL, Avoid the TGs (individually and by Department) I already know about. Not using discovery mode. It works great for finding new or unidentified TG.

To: BCD536HP@yahoogroups.com
Subject: Re: [BCD536HP] ID Search vs ID Scan

Yes, I know subscriber units are what they are called in Motorola-eeze. In Uniden-eeze they are called Units. There are tons of terminology differences between Land Mobile and scanners.

Anyway, as I mentioned in my first reply, I use ID Search all the time. That is the mode that searches/receives unprogrammed/unknown TGs. As for how to set it, read the quote 4 below from 4/14/2014 17:57.

Im so glad I started this thread.
The conversation has been terriffic.

What I have concluded so far is that if GPS determines what the scanner is set to I cannot change those systems' properties from ID SCAN to ID SEARCH.

Time to read up on discovery mode.

Regards,

Joey VA3GOC

GPS should not affect scan/search. What do you get if you
change the scan/search selection for that system via the menu?

GPS won't affect ID scan/search in any way. ID's are not affected by range or location, only TGID's are affected by range and location.

726. Losing it?

Yahoo group: BCD536HP
Date: 2014-04-17 21:43:30 UTC
From: Michael Lynch
Topic: 705 Message: 726

On my BCD536HP, I can set in the local zip code and pull up Peoria, AZ PD dispatch. I lock it in using the HOLD function and listen away.

The problem I have is that when I turn off the scanner and come back the next day, Peoria PD dispatch is still listed on the display, but I can listen to it for hours and nothing comes out of the scanner. However, if I program my local zip code in again and dial in Peoria PD dispatch - there they are once more.

Why is it losing my settings when I turn it off?

Thanks!

- Michael

Sounds like its a trunked system and the control channel changed while it was off. Many systems rotate the control channel every 24 hours - some rotate it even more frequently. You didn't mention how you held it, though - did you hold the Channel, Department, System, and/or Site?

Hi ALL
I would like to know how long I should wait until all the bugs are out of the BCD 536 HP ??
I have had heard many dissatisfied customers with many problems with there NEW and refurbished
Scanner. I also read the that serials numbers ending with 2006 (not sure if this is correct number) and above are OK and work fine anything below that number has big problems. any truth to this ??
I also read that the Hand held BCD 436HP does not suffer any problems is this true ???
both scanners came out in January of 2014 so you do you think after a year the mobile version sure be working correctly ?
Any thoughts would be welcomed !!!

Joe,

I am very new to this scanner.

If they rotate the control channel that often,
how do you keep up with it without starting over
from scratch and punching your local zip code every time you want to listen?

You SHOULD be fine with the 536, confirm the serial number before you buy it.

What "problems" have you heard? Are they actual problems or confusion on how the scanner operates? I've been very happy with my 436 and 536.

From: Robert Torio
Topic: 728 Message: 733

From my understanding (and experience), there is a known problem with the scanner following P-25 trunked systems when the normal talk groups are patched temporarily. In my situation, Oakland PD (CA) normally patches channels together in the morning when the calls are lighter, and then goes back to normal operation when the call volume increases. My GRE 800 is able to pick up the patched channels no problem (the display even indicates that the talk group is "Patched"), whereas my BCD 536 does not broadcast the patched talk group (it apparently cannot tell). I've been meaning to contact their tech support to see if a fix is coming, but franking I called them too many times already for other issues and too busy to deal with it. Hope this helps.

Bob

734. Clock set failure

Yahoo group: BCD536HP
Date: 2014-04-19 16:41:18 UTC
From: Mike Berriman
Topic: 734 Message: 734

I just powered up the 536, after it has been stood for a while, and it tells me to set the clock. Whatever value I enter for the "Day" produces an "Out of range error" and it then refuses to go any further forward. I have tried a reset of the system with no luck. I tried re-loading a saved profile using sentinel, again, with no luck. Anyone any ideas, please, before I send this back under warranty.
Thank you!

Best regards,

Mike Berriman.

First, I am a long-time scanner user but still am
using equipment from the dark ages.

I read this group's messages and see that there
is both complexity to and some problems with the
BCD536HP.

I see some others here struggling with the complexity
issue and having to learn new ways of doing things.
I guess the new two-way technology demands that
in a capable scanner. I am in the "Old dog, new tricks"
category myself.

When I see more members here exclaiming how wonderful
the radio is, I probably will get one. I also expect that some
are quite happy and don't say much.

Anyway, I started a new scanner radio Yahoo Group (my third)
and thought some here might like to explore it if you
live in Northern California.

Thanks for taking a look:

From: Iden
Topic: 734 Message: 737

Evan, I have enjoyed and posted to SCANnorCAL over
a number of years. When I conceived SierraScan, I was
really thinking just of Nevada County and surrounding
counties – but it evolved.

I belonged to norcalfire a few years back. I got sidetracked
doing aircraft scanning. Yesterday, I subscribed to norcalfire
once again.

I have not explored bayscan. I just brought it up and
it seems relatively quite active. Even though I am about
120 miles from the Bay Area, I do here stuff from there.
My scanner antennas are nothing special but they are up
and in the clear. My foothills location adds greatly to my
ability to receive in the distance.

Iden – Nevada County

= = = =

From: Evan Platt

Just to help - there's 2 fairly active N Cal Yahoo groups already - well 3

https://groups.yahoo.com/neo/groups/SCANnorCAL/info
https://groups.yahoo.com/neo/groups/norcalfire/info

https://groups.yahoo.com/neo/groups/bayscan/info

Bayscan is more "Bay Area" specific. :)

From: Paul Wolsko
Topic: 739 Message: 739

Sorry - the last message I sent seemed to become corrupted.

Just took it out of the box and fired it up. Seemed to be OK, and I set time/date & zip code. Seems like I am hearing stuff a lot further out than 20 miles - I am getting the NYPD, and we are 60 miles from NYC. Also, it seems to ask my for time & date every time I turn the unit on.

This normal?

For the time, leave it plugged in and turned on overnight (actually 50 hours to charge the real-time-clock battery, but a full charge all at once isn't necessary). Turn down the volume if you don't actually want to listen.

For the channel selection, selection is based on a combination of the scanners location/range setting and the department's location/range setting. If the department has a range setting of 40 miles and you have the scanner's range at 20 miles, then the department will be selected any time you are within 60 miles of the department (example).

From: Evan Platt
Topic: 739 Message: 741

What you can hear has nothing to do with 'distance' but has to do with your antenna, the height and power and antenna of the transmitting system, etc. There are some systems you may not be able to hear 10 miles away, while another system you may be able to hear 70 miles away.

You need to connect the scanner to power and leave it on overnight for it to charge the internal battery to save the date and time.

Yup, it's normal. You should review how the range function works.
Normally you'd leave the range set to zero and all systems whos range
overlaps your position would be scanned. No doubt the NYC system is
stored in the database with an overlay large range circle which covers
where you told the scanner it's located. That's why you are picking
them up. This is a function of radio system design and Radio
Reference's database having errors or omissions in the GEOTAG data
that describes the coverage area for the radio system.

The scanner must be left plugged into the charger and left ON
(scanning or paused) for 12-24 hours (or more) before the on-board RTC
chip's battery is fully charged. And that on-board RTC battery will
discharge in a matter of weeks if you don't use it. Once charged, it
won't ask you anymore. You should also install Sentinel and connect
the scanner to the PC. Read from scanner at least once so the
software will have a current copy of the configuration you've set.
Next time you perform an update and write to scanner, it won't
overwrite the scanner's configuration with defaults anymore. You MUST
"read from scanner" at least once to cure this behavior in Sentinel

Thanks, Bob. I am coming from a BCD396T, so this is a lot of scanner to figure out, and the manual leaves a lot to be desired. I'm sure there will be improvements in the doc as we go on.

Best!

Not on mine John. It stayed on 99 and I shut it down and restarted and it did retain it. It also downloaded some counties far off from me. That is what caught me by surprise. I won't complain but curious if this happened to anyone else.

Is the range setting dependent upon GPS coordinates? Or counties? Or Zip codes? I believe I posed the same query a while back when I noticed changing the range did nothing noticeable to my list of scanning systems when used only within the State of Connecticut. When I looked at the GPS settings I noticed the local systems (towns in the same county) all had the same long/lat's. I started to specify unique coordinates for each town in Hartford County. To date I have not finished but when done I plan to enter just the one county into the radio and attempt to set the range to a low miles setting and turn on location settings. I am hoping this post will spur comments on my endeavor and correct any inaccuracies on my part.

750. Concept question

Yahoo group: BCD536HP
Date: 2014-04-25 19:08:28 UTC
From: Paul Wolsko
Topic: 750 Message: 750

Have had my BCD536HP for a few days, have updated the RR database and brought the firmware up to 1.03.03 via Sentinel. So far, I have no issues, but I am struggling understanding a few concepts and wondering if anyone can clear it up for me.

Am I to understand that the scanner's ONLY memory is that which is stored on the microSD card? Following this:

When I turn it on and says (for me) loading NJ, NY, PA & Nationwide, where is it loading it to? A scratch-pad section of the microSD?

So I am assuming that this microSD card is a very busy, as all the work is being done off of it.

Thanks!

Paul
N2PJW

P.S. P25 transmissions are being received perfectly.

It loads to internal memory but is always checking it to verify things like what should or shouldn't be active. It is recording and erasing traffic to the card though in case you want it saved. How often is determined by the settings in record options.

752. Re: Concept question

Yahoo group: BCD536HP
Date: 2014-04-26 10:03:09 UTC
From: N1CHU
Topic: 750 Message: 752

The SD card is for storing the memory such as the frequency database (we update from time to time) and settings for the radio's microprocessor. When you turn on the radio the microprocessor has firmware instructions to access the SD card's memory, looking for boot up instructions. (I may be wrong here, the boot instructions might be stored elsewhere, but...) The microprocessor takes these instructions which in turn tell the microprocessor where to find additional instructions and data such as the frequency lists stored on the SD card. You will notice the radio hesitates when you turn it off with a message "Writing to SD card"? That's when the radio stores to the SD card any settings you may have changed while the radio was on before it completely turns off. Now, the next time you turn the radio on, you have all your settings preserved. If you just pulled the plug, instead of turning the radio off and letting the SD card update any changed settings, they would be lost and you would need to reset them.

Hope this helps

Disable "search with scan"

You can also hit SYSTEM L/O L/O when you are scanning those search ranges.

Thanks, José. The exact box is "MONITOR SEARCH WITH SCAN". Uncheck it.

Yup, works fine here on every system from single channel P25 to LTR, EDACS and so on.

Does the 536 show the tower on an active transmission in either display mode? I see the tower when its scanning but not when a talk group is active (the 436 shows the tower on active transmissions)

I think Paul (UPMan) answered that. He said you should leave the scanner on,
but can just turn down the volume if you don't want to actively monitor at the time.

If worse comes to worse you can always pay the lesser fee for your activation key provided you did in fact buy the programmer. Check the website for this. It's designed for those of us who forget where we put the key for safekeeping. "How you paid" has nothing to do with it, again, provided you did in fact pay the purchase price. If they can't find your payment information, send them proof. In the case of Paypal, contact them and they will take care of it for you. If Butel says they sent the activation key, then they admit you did in fact purchase the product but you've now got to show you never received the key. How you do that is beyond me. Good luck

Check your spam folder. It may have gone there.

Did you buy it directly from Butel or from ScannerMaster?

Then contact PayPal and file a complaint if its not too late (it may be now).
If it is too late, your only recourse is to contact Butel and request the key.
You could also contact your credit card company if one was involved,
but PayPal really doesn't want you doing that and may retaliate.

Then the question is did Butel send you the key? If they say they did and you did not get it, AND you told them right away (the same day or the next), they should resend it either by Internet or if you suspect it was lost due to an Internet problem, ask to have it mailed.

If it's a problem of letting too much time go by before you notified them that you did not get the key it looks like a case of them saying one thing and you saying something else. Your word against theirs. Good luck with that. Just be polite and appeal to them, hoping for the best.

781. I am confused - Sentinel issue noted

Yahoo group: BCD536HP
Date: 2014-05-08 18:33:59 UTC
From: Paul Wolsko
Topic: 781 Message: 781

Can anyone shed some light on this:

I created a new profile using Sentinel to try some things out. I have five favorite lists sitting in Sentinel: Our local police, the state police, a county trunked system, neighboring town police and the local EMS squad. So I write the favorites to the scanner and pull the plug, which restarts the scanner. Everything is great and I'm hearing I am expecting to hear. Nice.

I went back to Sentinel to add some additional favorite lists and, to my surprise, the systems and departments in my favorite lists are replicated in places they don't belong (which means it extends to my other profiles) and some of my conventional departments have disappeared. I tried collapsing the tree and expanding it to no avail, figuring it may be a display glitch in the software. So, I connected back the USB cable, and a read from scanner back to Sentineland the favorites seem to back in their proper order.

At first, I thought I was nuts, but this is the 2nd time this has occurred. Any thoughts?

Saving profiles does not work like you would think. It DOES NOT save any FL data. It only saves the scanner setup info that you would access in EDIT / PROFILE. So, if you save to a different profile, and change your FLs, you are changing your FLs for every profile. I realized that on my 24th profile version. Fortunately, I didn't lose any data since I was saving at each step of building my FLs.

Due to this, I had to use a second PC for my profiles that share the same FL names but have public data. (A profile I use for programming scanners for others who may not want some of the non-PS channels, or excluding confidential customer data)

... Oh how I miss Other programs, but that's how Sentinel was written.

It's also a pain when I want to help someone out and look at their profile and FLs. I have to trick Sentinel into using their info, then trick it back to mine.

So, Joe, what you are saying is that the profiles are entities in themselves - separate from profiles? That seems plausible, but the messed up favorite lists bother me. I must experiment with the Butel software, and see if that manages the Favorites better than Sentinel does.

Ok, Joe, so what we're really getting at here is what's updating the Mini-SDHC that's sitting in our scanner. It seems we have a split between the Favorites and the Settings, the totality of which becomes a profile - on the software, which views it as one thing.

I think I understand, and I think you do as well, but Uniden has a hell of a job ahead to make their documentation on this excellent scanner better, and I think we can help them do that. I hope Upman monitors this group.

The card is only updated when you write to the scanner, and everything is updated - profile, FLs, and HPDB if there is a newer one in Sentinel than what is in the scanner. Uniden has gone to great lengths to give the majority what they want, and that is reflected in the SW and the manual, which is different than previous manuals, and written in the style people want to see. I personally never had an issue with previous manuals, but I'm familiar with scanning and commercial terms. I really think that is the only issue of previous manuals - they were operations manuals and not manuals that taught you about scanners in general. To me, that's how it should be, but when you have people who want both in one manual, Uniden caters to the users. And yes, Paul monitors this list.

From: patirish@...
Topic: 791 Message: 791

1. I can only work with one favorite at the time. How do I download multiple favorites from my scanner?
2. I choose a frequency list from radio reference. It contains 25 freqs. When I DL to ARC536 only 5 freqs are DL's.
3. How can I backup all the favorites in the scanner?

Any suggestions would be appreciate.

Pat

You may want to try the Arc536 software list if you are having problems with Butel software.

I also have ARC536 but since I update the database weekly anyway, I use
Sentinel to put multiple frequencies in my favorite. You can highlight
and move a whole page of frequencies to favorites should you want to do so.

Wait... I use Butel religiously and have none of the problems I've seen here so far. I'm not an expert but listening to multiple FL's at the same time is a function of the radio. I just choose from the ones that I store on the SD card and I'm good to go. I used Butel to create the FL's and save them on the card. Mayby I have read the inquiry wrong?

But in any case, getting UNIDEN to update their software when a concern arises takes much longer than Butel's. During the "shakeout" beta period, Butel continuously put out upgrades as issues cropped up. And reporting these issues was more direct. I just emailed Butel and noted my findings. Grommet responded in person.

Having said all that, I don't think UNIDEN got it wrong with their sentinel software either. Just a matter of personal preference.

As I am STILL waiting for Uniden's Siren App, you can appreciate where I'm coming from. It's looking more and more like vaporware every day! But since both radios (436 & 536) have the same capabilities with the exception of WiFi, at $100 extra, I can only assume the $100 was for the non-existent WiFi capability. But I'm waiting them out as I'd rather have the WiFi instead of the money. I believe most think the same way. So if siren never shows, I'm in good company. Just feeling a bit foolish for buying a pig in a poke. The smart ones are still waiting before they plunk down their money, waiting for a tangible item that is available instead of placing their trust in a promise.

One mans opinion

Q1 and Q2: Do you have the evaluation (unpaid) version? Not sure, but that might be some of the limits to allow you to try the software before you pay for it. This way you can see of it really is better than the alternatives.

As for question 2, it is a trunked system? If so it might only be taking the control freqs, usually these are the only ones needed for Moto and P25 systems.

Maybe it’s me, but I didn’t see anything in the question about listening to multiple FLs at one time. The way *** I *** understood “work with” and “download” is that the OP wants to make various programming changes. In Sentinel, all you do is select the FL and choose edit. Unless something has changed, in ARC you can only make programming changes by downloading ONE FL AT A TIME. If something has changed, my apologies.

My point is I build a family of FL's and then download them to my scanners. In Sentinel I can copy all the FLs from the scanner, modify them as need and then reload all of them to the scanner.

If I am building a new family of FLs, ARC permits me to DL one from Radio Reference, not the group of freqs that I put in my family of FLs.

ARC seems very limited. It also has no way to backup your data except by copying one FL at a time and saving it.

On P25 and older 800 and 900 MHz. Motorola systems you do not need the other channels. The radio automatically goes to them as needed.

There are a few ways:

1. If you have a source with inside info, that's the best way.

2. If you have a source that uses the radios, you can ask what channel names they have.

3. Listen and deduce. This is the method most scan sits have to use, and there is a subculture that even enjoys the 'new find'.

You need to listen and figure out who is using the TG and.make your own tag for it.

I have a2 meter antenna on my roof about 30 feet up in the air, do you think it would work with the 536 to receive?

I did have another amateur saying it wouldn't work then I've heard others say it does it make a difference if you're just receiving you could use a clothes hanger.

What make/model is it? I have a 2M Ringo Ranger that works well on 800. It's not ideal, but it works. You can't damage anything by trying it as long as you don't have a transmitter on the antenna at the same time.

I have tried using my Comet GP-6 and my Cushcraft beam. They both do
fine for VHF but, what beats them all is the scanner antenna made
by Antennacraft. Here is a link:

http://smile.amazon.com/Scanner-Ant-Base-30-1300Mhz-50Rg6-15Elm/dp/B001JT1KEG/ref=sr_1_1?ie=UTF8&qid=1399932069&sr=8-1&keywords=scanner+antenna

I live in the country and can here digital traffic 60 miles away. The
antenna is mounted on a 20 foot pole in my back yard. I must warn you
that it is real flimsy and feels like it's made out of tin but it does
beat all my ham antennas lol.

That's a Scantenna and they do work well, but not so much on 800 MHz.
They still work, but they are not outstanding like they are on VHF/UHF.

Joe, the Favorite list names show, but I cannot see an indication that anything beyong ten lists are being scanned. I have an active aviation group there (Newark Liberty Airport), where I know there is activity, but see no indication that any list id scanned beyond 0 thru 9, and 0 thru 9 is scanning just fine. Has got to be something I am overlooking.

Joe, I am sorry to have bothered the list - I found out what the issue was by fiddling around and, yes, it was something I overlooked. I didn't hear aviation because I did not have that service enabled. Very different from my 396T but, at least I know. All is working as it should at this point.

819. One other thing I definitely miss

Yahoo group: BCD536HP
Date: 2014-05-13 04:07:05 UTC
From: SmokChsr
Topic: 811 Message: 819

Is the service search in the 996.
Hopefully I'm not just overlooking something from to reading enough.
The quick version, I had to send my vehicle in to the body shop, got it back and had only put in the 536, but not the 996 yet. Had some wild VHF band openings, and was hearing different repeaters coming in from several hundred miles away. Normally when this happens I just pull up the HAM service search and quickly find all the active channels and the CTCSS or DCS information in a manner of seconds.

Of course I pulled up the menu and search, but what... no service search, only custom searches which have to be set up. So I had an unhappy look on my face for a while. Guess I'll have to explore setting up a custom search, but I really didn't want to get into that just yet. Or better yet get the 996 reinstalled.

820. micro sd card not showing in sentinel

Yahoo group: BCD536HP
Date: 2014-05-13 20:40:33 UTC
From: James Jolin
Topic: 820 Message: 820

My 536 has worked since I got it....no problems. Then I decided to try the arc536 from butel. Wanted to see what the virtual display looked like. Well since then I bring up sentinel and plug in the usb cable...the computer beeps as usual but the drive does not show up and when I go to write to the scanner there is no sd micro card. Everything seems to be ok scanner wise. What is going on here?

Same here, Jim. Sentinel works just fine. I have ARC536 as well - the full version but, since it only operates on one Favorite List at a time, it is marginally useful at best and doesn't replace Sentinel. I have tried to get Virtual Control going with ARC, but have not had any luck. Perhaps subsequent versions will be better but, at this point, I prefer Sentinel.

From: terry bill
Topic: 820 Message: 823

A little bit of a thread hijack but if you haven't gotten ARC536PRO VC working, you don't know what you're missing. It definitely worth the effort if takes any effort. My VC has been rock solid since the first beta, getting more features with every release.

Besides controlling the radio from your desktop it includes logging per transmit date-time stamped Unit ID, system and department, signal strength to three digits, optional mini screen on minimize and a few more columns I'm forgetting right now. Recently recording was added and it's so much more usable than that on the radio. Recorded files are accessible from your desktop anytime and file names include the talk group and dept with no clipping of the transmission start.

Frankly I've done all of my 536 programming from ARC, finding it more intuitive than Sentinel. And once the programming is done and you're listening to the radio, VC makes it really shine.

Different (key?)strokes for different folks

Same here,
Jim. Sentinel works just
fine. I have ARC536 as well - the full version but,
since it only
operates on one Favorite List at a time, it is
marginally useful
at best and doesn't replace Sentinel. I have
tried to get Virtual
Control going with ARC, but have not had any luck.
Perhaps
subsequent versions will be better but, at this point,
I prefer
Sentinel.

>
> Besides controlling the radio from your desktop it includes logging per transmit date-time stamped Unit ID, system and department, signal strength to three digits, optional mini screen on minimize and a few more columns I'm forgetting right now. Recently recording was added and it's so much more usable than that on the radio. Recorded files are accessible from your desktop anytime and file names include the talk group and dept with no clipping of the transmission start.

825. ARC536PRO

Yahoo group: BCD536HP
Date: 2014-05-15 21:14:23 UTC
From: Paul Wolsko
Topic: 825 Message: 825

Initially, I could not get Virtual Control working, so I gave it another shot on this Win 7 laptop and, this time, it worked out fine. Went to Uniden. downloaded and unzipped the serial driver, which I had to install manually. At first, it didn't work again, but when I inspected the driver properties, I saw it was connected to COM9 - set ARC536 to COM9, then VC lit up and, I must admit, there's a lot to like there. Does it replace Sentinel? No, and Butel never said it does, but ARC536 is very a very useful tool.

827. USB Question

Yahoo group: BCD536HP
Date: 2014-05-17 20:16:18 UTC
From: Paul Wolsko
Topic: 827 Message: 827

Does anyone know if the USB connector on the front of the BCD536HP is functionally equivalent to the one on the back of the unit? Would be great if it is, as I find the one on the front in an inconvenient place - right below the enter key, which puts the wire in the way. Wish they would have put it on the side, but I guess that would have caused problems with a vehicle mount.

Aside from that, I'm liking this scanner a whole lot.

Thanks!

Paul

And here's a reply from me, who posted the question...an add-on to my original question. If the USB ports on the front and back of the BCD536HP ARE functionally equivalent, why make them different shapes on the ends of the wire???? I must be missing something.

No, they are not the same. The front is for communications with a PC, and the rear is for communications with the wifi dongle.

You're missing that they serve different purposes. One is a host
for the wifi dongle and the front is a slave device for the PC.

Gil, did you try to create a FL? You don't necessarily need to use a zip or range setting. If you got them on the 2096 then I see no reason you can't still hear them. The zip or range settings may confuse the issue. I don't know if the 536 is using the zip in conjunction with GPS or not...

The Nifty guides are a great accessory. When the manuals are a file that you download or you just want to save the manual that came with the radio in pristine condition, the Nifty's are a good way to go when traveling. I try and get one for every radio I own they are available for.

Topic: 828 Message: 836

I have owned the 2096 and it is a very sensitive scanner and I am not sure if the 536 can receive the same distance. If you create the FL with NYC in there, wait until you are hearing NYC on the 2096 and compare. With a FL you do not need to use either a zip code or range setting. You are on the outer limit for everyday listening at that distance although at 450 feet ASL and if on an outside antenna very possible.

Subject: [BCD536HP] P25 Improvement Test

We've been investigating the various reports of degraded P25 performance in some areas and noted with interest when reports surfaced that changing from NFM to FM mode improved P25 decode performance. We have tentatively verified this, but would like some more confirmation if you don't mind. Here is a relatively easy way to check:

First do MENU --> SETTINGS --> BAND DEFAULTS
Then, scroll to the setting(s) that have the frequency just below the range your local system is using. For example, if you are monitoring an 800 MHz system, scroll to the line that looks like:
849.0:NFM/ 12.5 MHz
Press E and scroll to change NFM to FM.
Press E two more times.
Then, check to see if there was any performance improvement.

For conventional P25, you'll still need to set MOD for the individual channels.

Based on the feedback we get from this, we'll be able to make adjustments that should reflect optimum settings w/o you having to tweak around with these settings.

Oh, and if your P25 decode is just fine, please do the above and see if it degrades your decode performance. We don't want to issue an update that fixes half of you but breaks the other half.

The scanned items are kept in volatile memory during operation. When you turn off power, the scanned items are lost. When you turn on power, the scanner reloads items to be scanned from the SD card. This cannot be avoided.

However, if you are scanning purely from Favorites Lists, you can turn off the Main Database so that only your (generally much smaller) Favorites Lists will load at boot-up.

Do you mean reload the database? No. It loads it each time.

Subject: [BCD536HP] P25 Improvement Test

We've been investigating the various reports of degraded P25 performance in some areas and noted with interest when reports surfaced that changing from NFM to FM mode improved P25 decode performance. We have tentatively verified this, but would like some more confirmation if you don't mind. Here is a relatively easy way to check:

First do MENU --> SETTINGS --> BAND DEFAULTS
Then, scroll to the setting(s) that have the frequency just below the range your local system is using. For example, if you are monitoring an 800 MHz system, scroll to the line that looks like:
849.0:NFM/ 12.5 MHz
Press E and scroll to change NFM to FM.
Press E two more times.
Then, check to see if there was any performance improvement.

For conventional P25, you'll still need to set MOD for the individual channels.

Based on the feedback we get from this, we'll be able to make adjustments that should reflect optimum settings w/o you having to tweak around with these settings.

Oh, and if your P25 decode is just fine, please do the above and see if it degrades your decode performance. We don't want to issue an update that

fixes half of you but breaks the other half.

Hmm.. never thought of that (disabling main database). How much of a time saver are we talking ? And which setting is that? Profiles/ "Monitor Full Database"?

The scanned items are kept in volatile memory during operation. When you turn off power, the scanned items are lost. When you turn on power, the scanner reloads items to be scanned from the SD card. This cannot be avoided.

However, if you are scanning purely from Favorites Lists, you can turn off the Main Database so that only your (generally much smaller) Favorites Lists will load at boot-up.

Yes, that's the setting. Try it and see. The savings depends on how large your FLs are.

So I unchecked Monitor full database. Appears to take the same amount of time to power up. When I power up though I'm loading my Favorites list only (I think there's a setting somewhere, right - just "Load Favorites only"? So maybe this is a bad test?

Or... When I unchecked monitor full database, and rewrote, I didn't need to check any of the boxes Force Full write did I?

But otherwise, no noticable difference in load time to me...

Topic: 485 Message: 850

Sounds like you are using Sentinel to do this... Try this instead... On the radio... Turn it on, hit Menu, choose the first selection which is Set Scan Selection. Then scroll down to Select Lists To Monitor. You will see Full Database and any Favotites Lists you created. Turn on or off those selections. For example, I turn Full Database to off. And turn on the Favorites List I want to listen to. As Paul stated, any FL you create is going to be much much smaller than the Full Database. And loading only that FL will be much faster.

Bill

On May 24, 2014, at 12:43 AM, "Evan Platt evan@espphotography.com [BCD536HP]" <BCD536HP@yahoogroups.com> wrote:

So I unchecked Monitor full database. Appears to take the same amount of time to power up. When I power up though I'm loading my Favorites list only (I think there's a setting somewhere, right - just "Load Favorites only"?
So maybe this is a bad test?

Or... When I unchecked monitor full database, and rewrote, I didn't need to check any of the boxes Force Full write did I?

But otherwise, no noticable difference in load time to me...

851. External speaker with 536

Yahoo group: BCD536HP
Date: 2014-05-26 02:15:07 UTC
From: Evan Platt
Topic: 851 Message: 851

Hi All,

So I picked up the 'combiner' to run 2 radios with one speaker in my car. A mobile ham radio, and the 536, The ham radio sounds great, but there's almost no audio on the 536. I didn't do the install, the stereo shop did, and the person who did it had left when I picked up my car, so I have to go back tomorrow. But anything obvious to look for tomorrow?

Is there more than one audio jack in the back of the scanner? Any suggestions?

Thanks :)

They most likely used a mono plug on the 536. You need to
use a stereo plug. Mono plugs short out the audio amplifiers.

At least, I think the 536 uses a stereo plug - I know the 436 does.

Headphone out is a stereo jack (otherwise, when you used earbuds you'd only get sound going to one ear).

Hmmm the cable I used was this -
http://www.amazon.com/gp/product/B00B9DQ2QI/ref=wms_ohs_product?ie=UTF8&psc=1

Then I had a 3.5 to 'phono' plug from radio shack. I'll have to see if I
can find the packaging or the receipt for it.

Are there two output jacks in the back? Maybe he used the wrong one? Just found the packaging for the adapter, it's a 1/4" stereo male to 1/8" stereo female.

That's the correct cable. The phono plug adapter could be mono or stereo. You need stereo.

The 536 does not have the line out jack. It was omitted since the 536 records (Although I wish it still had it, as recording is only one purpose for it)

Topic: 851 Message: 858

The ham radio probably has a couple of watts output on its "external speaker" jack with a MONO connector which may or may-not be ground-referenced. The 536 hasn't got an external speaker connector - it has a "headphone" jack which is very limited in output power (like 150 millilwatts/channel) and it's a STEREO jack. Both channels are independently driven and are usually not ground-referenced.

The combiner will have to be amplified and have a stereo input for the scanner. Depending on whether the audio is ground-referenced or not, you may need a stereo ground-loop-isolator for the scanner input (and maybe a mono one for the ham radio).

My guess is the stereo shop either didn't use a stereo cable or has completely screwed the pooch on choosing the combiner that doesn't amplify the input from the stereo source. With such dissimilar audio devices, you're going to need an amplifier on the scanner, more than likely.

Here's the mixer I bought:
http://www.amazon.com/gp/product/B000KGYAYQ/ref=oh_details_o00_s00_i00?ie=UTF8&psc=1..
And yes, they used stereo cables since that's what I provided :) And
it
is an amplified speaker .

Date: 2014-05-26 16:27:27 UTC
From: Boyd Prestwood K5YKG
Topic: 851 Message: 861

My BCD536HP has an external speaker 3.5mm jack on the rear panel and very efficiently drives several speakers I have including Motorola, Radio Shack and MFJ speakers with plenty of volume (not all at the same time!) and does not have to be ampified. The headphone jack is on the front panel, lower right hand side and not used in my setup. The Owner's Manual, page 88, confirms 360mW, 24-ohn nominal output with a nominal 4mW, 32-ohm on the L-side of the headphone jack. Page 9 bottom indicates additional caveats.

Hope this helps.
Boyd Prestwood, K5YKG

My suggestion has to do with the shop that did the work. So I say go back and ask them why they didn't check out their work, test it. You asked to two radios feeding one speaker. If you paid for that, that's what you should have gotten. Yea, I'd be back there so fast it would make their head spin!

Anyone know how to do a factory reset?
I am now getting the following error:

city data table read error
please check
CityTable_V1_00_00.dat
in SD Card

I removed the sd card but made no difference, thanks, Gil

They most likely used a mono plug on the 536. You need to
use a stereo plug. Mono plugs short out the audio amplifiers.

At least, I think the 536 uses a stereo plug - I know the 436 does.

No, there's only one 3.5mm External Speaker jack on the REAR panel which I believe to be mono. It will drive a small-to-medium mobile or fixed position speaker with plenty of volume without any amplification but you can connect an amplifier if you wish. There is a caveat on Page-10 of the Owner's Manual not to mix its "ground" (what's known in the telco industry as the plug's SLEEVE) and the power supply ground, so I took that to mean the audio "ground" floats. The Headphone jack is a stereo 3.5mm jack on the FRONT panel, down and to the right. It's black in color and matches the front panel so it is easy to miss! I have never used it so cannot speak to it's operation or merits.

Oops... I messed up on the Tech Specs... check out Page 90 for the BCD536HP (instead of the previously-quoted Page-88 (BCD436HP) in the Owner's Manual. The External Speaker jack on the REAR panel outputs 8-ohm audio at 5-watts which is quite different than the handheld!
Sorry for that confusion... it's been a long weekend!

Yea, but the rear jack is mono… unless something has changed. So if there's a mono short, that would mean that it would be at the mixer end and that they used a stereo input rather than mic or line. Another thought is ***possibly*** a ground loop, but I don't see the symptoms of that.

Dewey

They most likely used a mono plug on the 536. You need to
use a stereo plug. Mono plugs short out the audio amplifiers.

At least, I think the 536 uses a stereo plug - I know the 436 does.

"They've been good to me so I give them the benefit of the doubt"? What the hell does that mean? You paid them to do a job and they didn't do it! Period. No ifs, ands or buts. I am sure they would want to know if there is a problem and would be upset with you if you didn't bring it to their attention. If you still think they should have the benefit of the doubt, go ahead and not complain... and don't forget to pay the bill. The BCD536HP has only one EXT SP jack on the backside and it's labeled as such.

Did you try the clear user data first?

Is the PC recognizing the card?

"Nothing happened" is a little vague.

877. RE: [BCD536HP] External speaker with 536

Yahoo group: BCD536HP
Date: 2014-05-27 10:28:20 UTC
From: Dewey
Topic: 851 Message: 877

Joe, this would be a major departure from the practice on Uniden’s previous mobile scanners. The reason for the stereo headphone jack is because of the proliferation of stereo headphones on the market. Look how hard it is to find mono headphones these days, unless one can find “communications” headphones. The rear speaker jack has always been mono since it really is meant for a *speaker*.

Dewey

The scanned items are kept in volatile memory during operation. When you turn off power, the scanned items are lost. When you turn on power, the scanner reloads items to be scanned from the SD card. This cannot be avoided.

However, if you are scanning purely from Favorites Lists, you can turn off the Main Database so that only your (generally much smaller) Favorites Lists will load at boot-up.

880. Re: [BCD536HP] External speaker with 536

Yahoo group: BCD536HP
Date: 2014-05-27 18:53:11 UTC
From: Evan Platt
Topic: 851 Message: 880

They did the job I asked them to do. Looks like something on that amp unit isn't working right. If I plug a speaker directly in to the uniden, it works fine. When I put the amp into the equation, it doesn't.

Not to beat a dead horse but as I read your original post you asked the shop to use one speaker for two radios. Their attempt at that failed. Regardless of why. My point is valid. I just hate paying for something I don't want or didn't get. And how does the amp work on one side but not the other? You see, if they checked out the setup, they would have discovered it was only hearing one radio, did some trouble shooting and informed you of their findings. I'm done. No more replies from me. Good luck with the setup. I have thought about doing the same thing from time to time with 4 radios in my pickup. I was running out of space too. But I never got around to it. I think speaker mismatches were part of why I never did it, 4 ohms and 8 ohms.

If he asked them to install defective equipment, how is it their fault when he provided the equipment?

Had they tested the installation they would have discovered it did not give them the results they were striving for. At which point they could trouble shoot. At the very least they would have notified him it didn't work. Now, if the shop was told to just simply install everything (mount the speaker, plug in the connecting wires and plugs, etc.) then that's different. But that is not what the original post eluded to. Plus the comment about "giving them the benefited of the doubt". If it was simply a physical install of components why didn't he state that instead of the benefit/doubt comment? Hope he gets it working. It's not all that problematic and now that he has identified (?) the bad component he should be successful.

OK, here's what I gleaned from this conversation:

1 - the 536 has a speaker jack on the back.

2 - the speaker jack may be a 1/8 inch mono plug or it could be stereo. This has to be determined before you select a cable to the combiner.

3 - the combiner takes up to 4 monaural inputs and outputs to a single monaural speaker.

4 - the speaker jack may not have its negative side grounded - it's probably tied to the negative output of the audio amp and not to chassis ground.

So I suspect you supplied a stereo cable to the installer. If he used an adapter from 1/8 inch to whatever the combiner accepts, it would probably cause one of the channels to be shorted to ground. You will have to sort this out before proceeding further.

If the speaker jack is stereo (which I doubt) then inserting a stereo cable will connect the ring to one channel and tip to the other with the base as a 'floating' ground. In all likelihood the adapter on the other end of the cable will short out the tip's audio when plugged into a monaural input on the combiner, causing almost no signal to get into the combiner

If the speaker jack is monaural (probably) and you use a stereo cable, you will possibly short out the audio at one end or the other. If a monaural speaker (having just the tip and base with no middle ring on the plug) works then you need a monaural cable to the combiner.

Another problem is that you said the speaker jack has a 'floating' ground. In reality, it's tied to the negative side of the amplified audio signal and cannot be grounded or it will short out the audio. If this causes a problem, you will need a 1:1 audio isolation transformer (ground loop isolator) on the signal wire.

Most likely, you will need to make up the correct cables/isolation transformer yourself rather than blindly trying to buy something that's pre-made and probably won't work. What you want to do is not normal and I doubt anyone makes a cable assembly that does exactly what you want. Get out your soldering iron and install the correct plugs on both ends of a shielded audio cable and get exactly what you want. You should be able to do it or at least find someone who can solder it together for you.

Good luck.

Stereo cables seldom short the tip and sleeve.

But, if the mixer takes a mono input, the adapter may well be shorting the two.

>
> Another problem is that you said the speaker jack has a 'floating' ground. In reality, it's tied to the negative side of the amplified audio signal and cannot be grounded or it will short out the audio. If this causes a problem, you will need a 1:1 audio isolation transformer (ground loop isolator) on the sign al wire.
>
> Most likely, you will need to make up the correct cables/isolation transformer yourself rather than blindly trying to buy something that's pre-made and probably won't work. What

you want to do is not normal and I doubt anyone makes a cable assembly that does exactly what you want. Get out your soldering iron and install the correct plugs on both ends of a shielded audio cable and get exactly what you want. You should be able to do it or at least find someone who can solder it together for you.

I think Paul Opitz weighed in early and identified the speaker output jack as stereo. This makes sense when you consider both the amplified external speaker and the non-amplified external speaker from UNIDEN both use a stereo plug. Go back in the thread and you should find Paul's post. It should also be listed on the spec sheet. As for the questionable ground connection... Got a problem understanding why it wouldn't be chassis ground but if it is different, why should it be a concern? The audio signal will drive a speaker when it's only plugged into the one radio. So why not when connected with the combiner? I suspect the adaptor plug used to accommodate the change in the plug size has a stereo plug on one side and a mono plug on the other, or vice versa. Or to put it simpler, there is a need to change out a stereo plug for a mono plug or vice versa somewhere. But it's just a guess.

Bill

On May 27, 2014, at 6:08 PM, "bob.peloquin@... [BCD536HP]" <BCD536HP@yahoogroups.com> wrote:

OK, here's what I gleaned from this conversation:

1 - the 536 has a speaker jack on the back.

2 - the speaker jack may be a 1/8 inch mono plug or it could be stereo. This has to be determined before you select a cable to the combiner.

3 - the combiner takes up to 4 monaural inputs and outputs to a single monaural speaker.

4 - the speaker jack may not have its negative side grounded - it's probably tied to the negative output of the audio amp and not to chassis ground.

So I suspect you supplied a stereo cable to the installer. If he used an adapter from 1/8 inch to whatever the combiner accepts, it would probably cause one of the channels to be shorted to ground. You will have to sort this out before proceeding further.

If the speaker jack is stereo (which I doubt) then inserting a stereo cable will connect the ring to one channel and tip to the other with the base as a 'floating' ground. In all likelihood the adapter on the other end of the cable will short out the tip's audio when plugged into a monaural input on the combiner, causing almost no signal to get into the combiner

If the speaker jack is monaural (probably) and you use a stereo cable, you will possibly short out the audio at one end or the other. If a monaural speaker (having just the tip and base with no middle ring on the plug) works then you need a monaural cable to the combiner.

Another problem is that you said the speaker jack has a 'floating' ground. In reality, it's tied to the negative side of the amplified audio signal and cannot be grounded or it will short out the audio. If this causes a problem, you will need a 1:1 audio isolation

transformer (ground loop isolator) on the signal wire.

Most likely, you will need to make up the correct cables/isolation transformer yourself rather than blindly trying to buy something that's pre-made and probably won't work. I believe I did not clearly understand the question, thinking the question was regarding the front-panel jack. The rear jack is mono. Plugging a stereo jack into it will not short anything out in the scanner, it will just feed the same mono signal to the connected device. The audio does not reference to ground at any point. Connecting "sleeve" to ground would create a short to ground in the scanner's audio output.

So with that, should the stereo cable have 'worked'?

Yes. But, if the sleeve is grounded at any place, and it likely is in the mixer, that's the problem.

891. 536HP: Problem when scanning favorites lists

Yahoo group: BCD536HP
Date: 2014-05-30 11:14:33 UTC
From: Gil Kellersman Jr
Topic: 891 Message: 891

I have the following intermittent problem: If I scan a favorite list that includes 3 counties of conventional frequencies sometimes I get stuck in one county and it will not scan the entire favorite list. This also occurs sometimes if scanning 2 favorite lists at the same time as it will get stuck scanning one favorite list and will not scan the other list. This does not occur all the time but it does happen. I tried increasing the squelch but it made no difference. The only way to clear this problem is to reboot the scanner. This does not happen when I scan the database. Any suggestions? Thanks, Gil

894. Re: [BCD536HP] Re: 536 problem scanning favorite list

Yahoo group: BCD536HP
Date: 2014-06-03 18:44:06 UTC
From: gil Kellersman Jr
Topic: 485 Message: 894

I have a persistent problem. When scanning a favorite list with multiple counties, it scans fine for awhile then drops one of the counties. Likewise, if scanning 2 favorites at one time after awhile one favorite list gets dropped. If I reboot and start the scanning over it works fine for awhile then does the same thing. Uniden's answer was to do a FACTORY RESET and down load the favorite list from Sentinel again. I could never get to talk to a technician. Has anyone else ever experience this problem? Do I need to send the radio back for repairs. I am running the latest firmware and database. Any suggestions will be greatly appreciated, Gil

Sent: Wednesday, May 21, 2014 3:28 PM
Subject: Re: [BCD536HP] Re: 536 question

The scanned items are kept in volatile memory during operation. When you turn off power, the scanned items are lost. When you turn on power, the scanner reloads items to be scanned from the SD card. This cannot be avoided.

However, if you are scanning purely from Favorites Lists, you can turn off the Main Database so that only your (generally much smaller) Favorites Lists will load at boot-up.

895. Re: [BCD536HP] 536HP: Problem when scanning favorites lists-SOLVED!

Yahoo group: BCD536HP
Date: 2014-06-05 13:36:07 UTC
From: gil Kellersman Jr
Topic: 891 Message: 895

Okay, I solved the Favorite List problem by trial and error and playing with the scanner. As it turns out when scanning a favorite list if you hit the 'system ' button once it will ONLY scan the frequencies in that one county and will ignore the other counties. If you hit the system button one more time it will then go back to scanning the entire favorite list. Also I have been using the Uniden manual and the Niffy guide which is not as useful as I had hoped for. I did however find a really easy to read manual written by a scanner guy (Mark) that understands the 536HP backwards and the good news is this manual is free, see below. I welcome any comments, thanks, Gil
http://marksscanners.com/536/436_536.shtml#delete_list

Subject: [BCD536HP] 536HP: Problem when scanning favorites lists

I have the following intermittent problem: If I scan a favorite list that includes 3 counties of conventional frequencies sometimes I get stuck in one county and it will not scan the entire favorite list. This also occurs sometimes if scanning 2 favorite lists at the same time as it will get stuck scanning one favorite list and will not scan the other list. This does not occur all the time but it does happen. I tried increasing the squelch but it made no difference. The only way to clear this problem is to reboot the scanner. This does not happen when I scan the database. Any suggestions? Thanks, Gil

I posted this message this am but it did not post. I have an intermittent problem when running a favorite list comprised of conventional frequencies in 3 different counties. Some times it gets stuck and only runs 1 county. If I reboot it then works okay.

Also, when running 2 favorite lists they both will scan but sometimes it gets stuck on 1 favorite list and does not scan the other favorite list. I called Uniden and their ONLY answer was to do a hard rest if it persists which will erase all favorites but then can be reloaded from Sentinel. Any suggestions, thanks, Gil

Hi Joe, there seems to be a problem with posting on this list as I sent out post yesterday explaining that I had figured out the problem with a lot of experimenting. I am truly amazed at the capability of this scanner as I am learning new things daily.
I now see when scanning a favorite list with multiple counties in it IF you hit the search button once while scanning it will LOCK into that county only UNTIL you hit the search button again when it will resume scanning the entire favorite list. Likewise the DEPT button acts the same way. I have made more progress in learning this scanner by just by playing with it.

I am amazed at the sensitivity of the receiver. I live in Shelton, CT, 450 ft above sea level and regularly receive NYC PD & FIRE on a separate favorite list. Has to be 70 miles line of site, using a Diamond RH-77 antenna mounted on the scanner. I like the fact that this scanner has many features that I have not even discovered yet so I am very happy with my upgrade from the RS 2096, thanks again, Gil

I believe you mean "SYSTEM" button, not "SEARCH" button (since there is a SYSTEM button that behaves the way you describe and there is no search button other than the secondary 1, 2, 3 quick search start buttons that behave an entirely different way).

Given the updated info, you are putting the scanner in SYSTEM HOLD mode
in which case what you are seeing is exactly what you 'told' the scanner to do.
(Or DEPARTMENT HOLD in the case of the DEPT button.

I haven't had that problem but haven't had the 536 left "on" for more than 12 hours at a time.

But given the obvious assumption that Uniden most certainly had a 536 set up on a test bench during its testing phase, and continuously running, I'm going to suggest doing a factory reset and trying it again. When you reload your settings/programming, load them back one at a time and let it run. If the radio does the same thing, remove the last thing you changed and see if it goes away. A rudimentary beta test if you will... Post your findings here and hopefully Upman will have it looked at.

Given the multitude of variable settings, It sure would be nice if Uniden had a process whereby you could plug your radio into the computer and send your unique configuration to them. And they in turn could load a radio with your exact settings to trouble shoot your issue. Granted, they would probably be swamped with requests to trouble shoot but a diagnostic program could be developed that automatically responded with the probable cause of the more common issues with corrective actions listed, reducing the number of submissions And the more perplexing issues addressed by Uniden staff. I know, the workload would still be taxing to Uniden and a comprehensive diagnostic program would forever be in the "work in progress" updating mode that wouldn't ever be completed as Uniden moved on to a newer generation of scanner, assigning more and more resources to the R&D of the new stuff.

Bill

If it's trunking priority, that needs to be activated on that particular Trunked system's options menu.

The Priority you activate through the keypad is only for conventional priority.

Manually go to one of your priority channels. What does the display show for lockout and quick keys.

But the message displayed indicates he is trying to activate
conventional priority and no priority channels are enabled.

If it's a p25 system, then you have to activate it via the menu as Jose said.

I've had mine on for months without powering down.
What your describing sounds more like a corrupt SD card causing an issue.
I rarely turn any scanners off. They run 24/7 365. I update them as needed but that's about the only time they get turned off other than power outages.

Sent from my Verizon Wireless 4G LTE DROID

928. Favorite Systems not scanning

Yahoo group: BCD536HP
Date: 2014-06-10 18:27:30 UTC
From: photogusa3@...
Topic: 928 Message: 928

Hi everyone,
I just picked up this scanner on Saturday.
I am totally stumped. I have copied some systems (Multnomah Co., OR / Clackamas Co., OR, IWN as examples) to favorite lists. The problem is that some of them will not show at in the favorite list, yet they show and scan fine in the full database scan?!
The list/system is enabled with the scan selection but does not show. If everything but one of the not working systems is disabled on the lists, it tells me nothing to scan! This happens with the location function turned on and off with multiple different ZIP codes in the area tried.
I kind of wish there was a way to switch this scanner into sort of a "dumb" mode where is only scans what it is told... ;) The 996 was so much easier to for me use at this point in time.

Also is there any way in the full database scan to turn off certain sites on trunked systems?

Thanks,
Achim

Okay, I had the exact same issues at startup, now the scanner is 2 weeks old and humming! When you scan a favorite list try hitting the system key ONE time. Now you should be scanning the entire favorite list. When scanning IF you hit the system key once it will then LOCK IN to only that portion, ie a county, that you are scanning, good luck, Gil

Subject: [BCD536HP] Favorite Systems not scanning

Hi everyone,
I just picked up this scanner on Saturday.
I am totally stumped. I have copied some systems (Multnomah Co., OR / Clackamas Co., OR, IWN as examples) to favorite lists. The problem is that some of them will not show at in the favorite list, yet they show and scan fine in the full database scan?!
The list/system is enabled with the scan selection but does not show. If everything but one of the not working systems is disabled on the lists, it tells me nothing to scan! This happens with the location function turned on and off with multiple different ZIP codes in the area tried.
I kind of wish there was a way to switch this scanner into sort of a "dumb" mode where is only scans what it is told... ;) The 996 was so much easier to for me use at this point in time.

Also is there any way in the full database scan to turn off certain sites on trunked systems?

Thanks,
Achim

Thanks for the answer, but that is not the issue.
The systems will not show up at all, you can't even manually change to that system!
The hold functions for system, dept. and channel are all turned of.

73,
Achim

The scanned items are kept in volatile memory during operation. When you turn off power, the scanned items are lost. When you turn on power, the scanner reloads items to be scanned from the SD card. This cannot be avoided.

However, if you are scanning purely from Favorites Lists, you can turn off the Main Database so that only your (generally much smaller) Favorites Lists will load at boot-up.

Do you have the Service Type enabled you assigned to the channels?

Did you set any Quick a Keys and are they enabled?

I think Uniden needs to wake up or their scanner business is not going to be very positive. They need to make technicians available and they need to respond to to questions on this reflector. I really have never seen such poor customer relations. It is really a very difficult scanner to learn to use. It took me weeks for me to learn how to use it. There are so many features that it will stay take me many more weeks to really understand and learn how to use them all. On the plus side, I find the scanner to be more sensitive then my 2096 and the digital reception is excellent. looking forward to my continuing challenges, Gil

John, my 536 is working fine now, however, when I was having issues in the beginning it took me 4 days and about 30 plus phone calls just to speak to a rep on their customer service number. When I finally got to a person their ONLY solution was to do a hard reset! He had no other options! I really find this unacceptable. I have been a ham since 1961. When I call Icom or Yaesu for technical assistance I get a real technician immediately on the other end not just a kid reading off from a standard cheat sheet. Maybe you can provide me with the Uniden service number where if I need to speak to a real technician I would appreciate this for any future support issues.
The other issue is where is the siren app that Uniden has been touting for more than 6 months? See what I mean? Spending $600. for a scanner should provide some level of better support. Thanks, Gil

948. P25 Trunking Question from a New User

Yahoo group: BCD536HP
Date: 2014-06-24 17:20:10 UTC
From: simoco_user_nz@...
Topic: 948 Message: 948

Hello Everyone,

I have recently acquired a 536HP, car mounted it and find it a fantastic product. In my local area we have a Simulcast Phase 1 P25 system consisting of approximately 23 VHF and 23 (ish) UHF towers with a mixture of encrypted and non encrypted talk groups. From time to time the CC frequencies cycle around (as expected) for each tower and I have 2/3 frequencies per tower with GPS location services turned on and working perfectly (love that feature!).
Unfortunately: Because two or more towers have the same group of control channel frequencies while a tower that is outside of my desired area is locked out, it still gets through because it's frequency is stored as a CC for a tower that is within range and thus unlocked. If the non-desired frequency is first in the list, it overrides the control channel I actually want (ugh).

Questions thus:
I see some discussion about RSSI threshold in looking through the history of group discussion and this would alleviate the problem reasonably - is this possible / likely to be included in future firmware?
Also - has any thought been given to being able to assign a tower ID within the frequency edit options and if it doesn't match then that frequency is temporarily avoided (if avoiding still results in 1 or more unavoided frequencies for that site).

General commentary: I would also vote for having the current/active CC Frequency displayed when the scanner settles on a talkgroup.

Thanks,
Ant

No offense, but it sounds like - based on reading through many of your questions, it's just a learning curve rather than the scanner not doing what 'it says you can do'. But if you want to sell it, go for it. This just sort of contradicts what you wrote a few weeks ago:

"Any issues on the model 536. I have been using the 436 model for about a month and have no issues with it whatsoever."

So what happened between then and now?

What issues were you having? Did the hard reset fix the issue? Is it possible that was / is the only fix for the issue you're having?

Why did you make 30 calls over 4 days? That should have been one call until it was resolved. I think we're only getting part of the story here.

Just want to put in my 5 cents regarding this scanner. I have both a GRE 800 and this scanner. I purchased the Uniden with the intention of having what I thought would be an upgrade to the GRE, given all the hype preceding its release. In my opinion, my GRE outperforms the Uniden in areas important to me.

From my understanding (and experience), there is a known problem with this scanner following P-25 trunked systems when the normal talk groups are patched temporarily. In my situation, Oakland PD (CA) normally patches channels together in the morning when the calls are lighter, and then goes back to normal operation when the call volume increases. My GRE 800 is able to pick up the patched channels no problem (the display even indicates that the talk group is "Patched"), whereas my BCD 536 does not broadcast the patched talk group (it apparently cannot tell). I've been meaning to contact their tech support to see if a fix is coming, but franking I called them too many times already for other issues and too busy to deal with it. There is also audio issues where the first part of the P25 transmission is frequently cut off. Side by side comparisons proves this to me. Why can't Uniden at least match up to GRE in these areas ? I guess I was wrong in thinking this would be an upgrade to me.

At least the mobile unit looks good on my desk. There are some features I like, however, can't justify the $600 price tag.

Gil,

I had occasion to talk to an independent ham radio dealership owner the other day who also sell Uniden scanners. We were discussing how he priced the ham gear and how the larger outlets were selling in volume, discounting their pricing. It made for a bare bones market. He says it also holds true for the scanner market. I mention this because these markets are small, not that many people out there interested in the hobbies. And that means anyone producing the gear looks at it as a niche market where growing a profit margin is difficult. So the prices are high (at least it seems to me) but at least the stuff is available. Uniden's take on the scanner market is one of simplicity for the end user, or customer. They have simplified the radios to where a person who has no technical knowledge of the comm systems being used by public safety agencies can be up and listening in the shortest amount of time by offering the ability to program a scanner with only the knowledge of their zip code. Almost. That goes a long way with market share. Uniden expects to sell more radios. The many issues that people who are new to the hobby have are, for the most part addressed by the user groups on the Internet. Because even though these radios may be simpler or easier to get running, there are still a bunch of variables these babies are capable of. And there's the pinch. Someone new to the hobby is not going to do well when reading the manual. There are many unfamiliar terms and procedures associated with the menus that can boggle the mind. There was a time when I could throw the manual over my right shoulder and wing it. Not so much anymore.

Uniden's tech support group wishes all their calls would relate to suspected technical aspects and NOT basic operational questions but when a scanner is as daunting as the Home Patrol series where they are loaded with just about every capability they can make the radios do, it can be frustrating. I like to think of the learning curve as merely an opportunity to extend the newness of the scanner, learning something new about it for months after I get it. I don't use half of the available versatility but it's there if I want it later. To me its a work in progress that may never end. It's open ended.

I have purchased the Jiffy Guides to help with the manuals but still resort to the amazing resources available from the user groups. I ask stupid questions and get stupid answers. I ask intelligent questions and get stupid answers. But along with all the wise cracking I also get those in the know who helped me through all of my problems. And every one of my problems was due to interpreting the manual incorrectly on my part! We all can get it wrong for various reasons but after someone explains it an understanding happens. Use the user groups. Paul Opitz won't chime in unless he sees the need. Because the groups do such a good job, Paul's input isn't needed. And that's why he has few postings.

The only gripe I have with Uniden is their dismal failure to produce the Siren App. The way I figure it I paid an extra $100 for a feature I never got yet. But Mr. Opitz says its in the pipeline... Just so sick and tired of hearing "Any day now, any day".

Bill

>
> John, my 536 is working fine now, however, when I was having issues in the beginning it took me 4 days and about 30 plus phone calls just to speak to a rep on their customer service number. When I finally got to a person their ONLY solution was to do a hard reset! He had no other options! I really find this unacceptable. I have been a ham since 1961. When I call Icom or Yaesu for technical assistance I get a real technician immediately on the other end not just a kid reading off from a standard cheat sheet. Maybe you can provide me with the Uniden service number where if I need to speak to a real technician I would appreciate this for any future support issues.
> The other issue is where is the siren app that Uniden has been touting for more than 6 months? See what I mean? Spending $600. for a scanner should provide some level of better support. Thanks, Gil

From: Teton Amateur Radio Repeater Association
Topic: 954 Message: 954

Hello Group,

Just wondering how this radio is for manually programming this radio? It always seems that radios that "self program" usually aren't very close or out of date with frequencies. Most of the time I prefer to enter frequencies myself. Wondering how well this radio cooperates for this.

The scanner is fully programmable by hand or using the supplied Sentinel software (which you can d/l from http://info.uniden.com/UnidenMan4/BCD536HP). If you understand the architecture of trunked radio systems, then it is not difficult to do basic programming. It is, however, tedious.

That said, the database built into the scanner (and Sentinel) is updated every Monday morning with the latest radio system information available from RadioReference.com. You will find that it is very close and very up-to-date.

If by "manually" you mean using the keypad, the answer is very tedious.
If you mean using software, that depends. I found the Sentinel software
difficult to use, so I bought ARC536 for developing Favorite Lists,
Systems, Departments, and Channels.

Other people find Sentinel easier to use, so they use that.

The RRDB is pretty accurate from what I've seen and I plan to use GPS
and the built in database for most of my upcoming southern road trip.

Well I think what the OP was getting at is depending on how 'old' the scanner is, the database on the scanner is very likely easily a few months old? So say my 436 I got in say March, may have a database installed on it in November? Granted that may not be that old, but if a local department made a change in January, it wouldn't be on the 'brand new scanner'.

I disregard what the factory load is, since it takes less than 10 minutes to get the current db (including installing Sentinel and putting batteries into the scanner). I believe the OP was referring more to the type of dB that is in the BCT15X (put in the firmware and not subject to revision by the user).

than 10 minutes to get the current db (including installing
Sentinel and putting batteries into the scanner). I believe the
OP was referring more to the type of dB that is in the BCT15X
(put in the firmware and not subject to revision by the user).

> Well I think what the OP was getting at is depending on
how 'old' the scanner is, the database on the scanner is very
likely easily a few months old? So say my 436 I got in say
March, may have a database installed on it in November?

Granted that may not be that old, but if a local department
made a change in January, it wouldn't be on the 'brand new
scanner'.

From: Ron Spaulding
Topic: 966 Message: 966

Each time I turn on the BCD536 I have to enter the time,date. It seem to be kinda of pain when you in a hurry to start scanning. Is this just something I have to live with, and the scanner is continually plugged in via the wall wart, which is not on a switch, so its hot all the time.

Thanks,

Ron

967. WiFi

From: kc0sbl@...
Topic: 967 Message: 967

I am just about ready to buy this unit and have read everything I can find on the internet but cannot find the answer to one question: does the WiFi feature work at all or is it just sitting there uselessly until Uniden releases the Siren App?

Regarding the App, all the Uniden site says is "App Release Coming" - no info on whether that is soon or just some far off concept. UpMan is usually super helpful on the forum but I note that a question to him on the subject has not been answered.

So - the question is, can you use WiFi without the App and, if not, when can we expect the App to be released???

Have you ever left the 536 turned on so it can charge the clock battery?

You need to leave the 536 powered on for I'd give at least 24 hours (the more the merrier - I think the book says 40?) for it to charge the internal time clock battery.

The issue doesn't seem to be so much with the app as with the WiFi dongle that is built into the scanner. There have been driver issues with that that the dongle manufacturer has yet to resolve.

So, it would be more a case of using the app without the WiFi, but I don't think Uniden designed it that way. Personally, I'd like to see that, but I doubt it will happen.

976. BCD536HP Died

Yahoo group: BCD536HP
Date: 2014-07-09 21:07:06 UTC
From: Don Griffey
Topic: 966 Message: 976

Hello all,

I have had my scanner since March 1st and it has worked mostly flawlessly. I did turn it off for a period of time and the backup battery ran down about a month ago so it's been powered on ever since and just the volume has been turned up and down. Yesterday and this morning I noticed highly distorted audio on a <http://www.radioreference.com/apps/db/?sid=6355> Tennessee Advanced Communications Network (TACN) system that uses Project 25 Phase II TDMA modulation which has always decoded correctly in the past. So, based on similar episodes with my BCD396XT and BCD996XT, I turned the scanner off, waited about 15 seconds and turned it back on. Now all I have is a flashing backlight display. I unplugged it and left it off over 8 hours until after I arrived home from work. I plugged it back in and turned it back on but it still does nothing but flash the display backlight. (This similar to what I heard folks talking about when a firmware upgrade failed on the XTs.)

Has anyone heard of this happening to this scanner?

Thanks,
Don Griffey, KE4JD

From: n1chu@...
Topic: 967 Message: 977

As for the latest on the Siren App... Mr. Opitz has stated when there is something new to report he will. Until then, we have only his last post that says (in essence) they are working the issue, with no projected release date. I gather from what I've read that there seems to be a problem with the dongle? And they are attempting to fix with new software development. Correct me if I am wrong, but the bottom line is "Wait and see". I call it VAPORWARE! But I also have faith that Uniden will finalize the issue with either a release, replacement of the dongle, or if all else fails, a credit of some sort. The BIG question is WHEN? Hope this helps, Bill

Topic: 966 Message: 979

Sounds like you have a need to contact Uniden for repair/replacement instructions. I sure hope your problem is not systemic! The only suggestion I have for you (before contacting Uniden) is to try formatting your SD card. Because your radio won't play, you will need to remove the card to your computer. Format it and then load a known good file to it. Replace the card in the radio and hope she boots up. Or, find someone close to you that has a working 536 and swap cards to test your radio. Maybe you live close to a dealer who has them on the shelf and would be happy to help you...

It should not be (emphasis- should not, but might be) a matter of drivers since it's simply external storage (literally an sad card). Maybe look at device manager to see what driver it's using and update or roll it back. You are selecting mass storage on the scanner, aren't you?

Joe,
Ya I'm using mass storage. But on device manager I don't see any ports like I do on Windows 7. So I can't do much about a driver....the question now becomes where are the ports. You know when you plug in a usb or connection the computer beeps at you and gives you a message about what you just plugged in. That does not happen. Sorry I don't have better info.

Try it direct - preferably on a USB2 port.

Did that. Used usb3 through a hub. Device manager reports (Now) uniden serial port com 3, but still the sd disk is not reconized. And you can't tell Sentinel what com port to use. Is sentinel looking for any particular com port? On the windows 7 machine the sd card is on com 6. Device manager says com 6 is in use on this windows 8 machine.

You should only get a serial port assignment if you select serial on the scanner. To access the card, you want to select mass storage. If you are still using the hub, try one of two things - either try connecting direct to a pc USB port, or try unplugging the hub's usb connector that goes to the pc and plug it back in.

From: Bob Peloquin
Topic: 982 Message: 990

I suggest you go here
<http://pcsupport.about.com/od/windows-8/a/disk-management-windows-8.htm>
and read about accessing the disk management tools in Windows 8. From
there, see if you can identify the device that Windows 8 thinks is the
HP. No doubt, it doesn't have a drive letter assigned. You can
assign one from there and it will then work as expected.

Subject: RE: [southalabamascan] Re: City of Mobile System

We have been given authorization to purchase a ☐receive only☐ radio to monitor dispatch channels. Unfortunately, living in the corporate world, it has yet to approved for purchase farther up the chain here. I agree with the public☐s right to know, I do think though, it will take a lawsuit to force agency☐s to open up the ☐routine☐ channels to the public. Spec. Ops, Investigations, Tactical channels .encrypt away, Daily operations should be open.

Right now we chase stories off the Fire channel, this gives us wrecks, shootings, fires, etc We are, however, cut off from incidents that don☐t involve Fire/EMS. Hopefully that will change sooner rather than later.

I have seen dozens of stories on the web about issues with, specifically, Motorola encrypted systems. Most, though, are several years old. Have these issues been resolved? (Poor coverage, delayed time to access the network when radio keyed, background noise distorting the encryption process)

In my own opinion, these issues pose a much greater threat to the men and women who rely on them as their life line.

To: southalabamascan@yahoogroups.com
Subject: [southalabamascan] Re: City of Mobile System

I sometimes tune into the Mobile County system from my home in Fairhope. I have been under the impression that the system currently in use by the City of Mobile is ProVoice and is part of the County's otherwise analogue EDACS system, and that both city and county will migrate to a 700MHz P25 system similar to that of Baldwin County. I also have heard that the MPD will be encrypted but the MCSO will not. How does my understanding of this situation compare to others?

That said, I have difficulty with some of the open P25 traffic here; the audio sounds muffled at times on my Uniden BCD536HP.

Brad, how do you chase news stories with some police dispatch systems either being encrypted or other not accessible? I think the public's right to know by far trumps any "officer safety" excuse the powers-that-be can dream up. What kind of feedback do you get from these agencies that keep us all in the dark? Just wondering...

Paul's current avatar clearly shows a color screen which the x36
scanners don't have. His avatar may be depicting the analyze feature on
the Home Patrol 1 scanner which does have a color screen.

I'm new to this list and just got the '536 yesterday. I read up on it before I bought so I was aware of some growing pains. I also read the manual several times, something I don't normally do (one of my user interface tests with any new toy; does it make sense innately or do I have to read?).

I suspect that since the wifi issue has taken SO LONG (still under a year since the release but 30+ day increments, really?) that another source of dongle (LOT'S of options there) will have to be made which will ultimately cost Uniden (in sales and replacements). So far it isn't even seeing my home LAN (which is dual band, 2.4 GHz and 5 GHz and plenty strong).

Without hijacking the thread, I also see that the Sentinel software is not fully fleshed out yet either (lacking a LOT of things that should be working, like ability to set alerts, priorities, adding items NOT in the database etc.). Yes, there are other software options; this program needs more work, it isn't mature.

The manual says what can be done, but even though I am quite literate in geek, it's hard to read/understand and is lacking on some simpler how-to information (how to add something NOT in the database, like most ham repeaters). I'm mostly just happy that it isn't transliterated Ingrish. ;o)

Even the online 'simplified' manual could be better for the non-geek. This is a very technical and complex device; the user interface needs to be simple to do the mundane, yet more complete; same with the manual.

In short, a good user interface makes the complex, simple to do. We're close here.

So for now I'm viewing the entire situation as a work in progress (released less than a year ago, I went through similar growth problems with the GRE line). It's not that big a risk to me because it's doing what I require of it for now and I'm hopeful of a rapid resolution of the issues; because being able to wifi to a tablet is potentially HUGE for me; on a par with the GPS self-altering the frequencies as I move around (I travel, a lot). I could put the scanner in a safe place (in the RV, under the back seat, in another room) and simply USE it from wherever I happen to be. [I'm presuming that the audio gets passed on wifi too, somewhat vague in the reading.]

On the plus side, the audio is MUCH better than my Pro-96 and Pro-2096 but it tends to be a bit bassy (trunked systems) so I'll use a tinny

speaker to offset that. [Too bad no 'stereo' line out jack to feed into the vehicle audio system, rear speaker is mono only while the headphones are 'stereo'.]

I look forward to (forward) progress and hope things are resolved sooner than later. I'm also willing to be a beta tester, duh. :o) Whatever speeds up the process...

Ok group, before someone points it out, there IS a way to modify some of the x36 settings per dept/channel AND add new (non-db) frequencies. It wasn't in plain sight, therefore fails my intuitive test. But I found it.

I'm still trying to wrap my head around the logic of DMA programming... it's... different. I was able to get the wifi linked to my LAN after a firmware update to the dongle (not that it DOES anything yet).

Now I'm trying to figure out how to best use the GPS (available from my APRS GPS) for self-programming on the fly while traveling... hope it's not just for Favorites... but let's keep this topical, I don't want to hijack the thread (again). If I hit the wall again, I'll start a new thread.

Siren app, sooner=better.

The GPS works with all frequencies in the main database that contain coordinates (I have yet to see any that don’t). It will also work with all FLs that include coordinates as long as “Location Control” is turned on. When travelling, I will only use the main database, and keep the range set to 0.0 (zero).

It’s the opposite. Instead of the x36 looking “out” x number of miles based on the radius, you must already be inside the system’s/department’s/channel’s programmed radius to receive. The bottom line is that you are telling the scanner not to look beyond your current location for systems/departments/channels that are using location control. You will still receive all systems/departments/channel when you are inside of their radius rings.

It will also work with all FLs that include coordinates as long as “Location Control” is turned on. When travelling, I will only use the main database, and keep the range set to 0.0 (zero).

I've noticed that the GPS coordinates for the data listed for my state (Ct.) is on a county basis. All towns in a county have the same GPS coordinates. I am trying something different. Changing the GPS coordinates of each town to the town's central location or the central transmitting antenna's location. I have one county almost completed and need to test it while mobile, driving from town to town, using the 536 with location control engaged and another scanner without. I am hoping to get a general idea of the ability of the location control's limits. I will start with a circular pattern and then I might try refining the GPS to a rectangular footprint. But I have reservations. I wonder if the time and effort I will invest will prove worthwhile. The range settings don't seem to be very accurate for my idea of going from town to town, picking up a new Police Dept and dropping the town I just left. The feasability of what I propose is what I call the "ideal" results of location control. The trouble is, attempting to attain it may be a bit premature. Determining unique GPS coordinates for every system is close to impossible when FCC License info can list numerous antenna locations and geographical footprints of municipalities show vast differences in shape and size. Radioreference data updates would need additional user submitted input data that include "unique" GPS settings for each radio system with rectangular (instead of circular) coordinates. Or so I think. But if striving for this optimum form of location control was not the intention of Uniden's location control, why offer it to begin with? I see it as a collaborative effort between Radioreference and Uniden, whether intentional or not. So now that it's out there, maybe it's time to run with it... My test subject is Hartford County, State of Connecticut. I am changing GPS settings for each town/city within the county to central locations. If it works, I will expirement with rectangular instead of circular, further enhancing my geo-footprints. Comments welcome.

You don't want to use the transmitter location. You want to use the center of the geopolitical entity, and a radius that covers the whole entity but not much more.

For a town, you just want that town. For a county, just that county. If a service covers more than one town, you want the coordinates to be the center of the whole coverage area with the radius to be just enough to cover way they cover.

From: Rick Bates, WA6NHC
Topic: 992 Message: 1004

Ok, thank you.

I asked because sometimes zero translates to no limits (even with the limiting feature "on"). Specific to only "here" might be too limiting while traveling.

The 50 mile range limit (about 40 minutes of highway driving) may not give enough advanced warning about a traffic condition ahead (a wreck, slide, closure etc) for rerouting. For that, 100 mile range would be better, presuming the radio system being heard allowed it (many do, terrain dependent). I routinely listen (at home) to a P25 network on ~490 MHz (MERA, used by my former employer) that is 90 air miles away over a couple ranges of hills (ok, I set up specifically just to do that, in Favorites and with a superior antenna).

I'm really looking forward to trying the GPS feature out on the next road trip. For anyone with a Kenwood TM-D710 radio AND the GPS710 option, you can take the GPS output NOT going into the '710 (other side of the GPS) and feed that into BCDx36HP GPS input. Slick.

Now if the wifi (Siren) worked, I could also mount the x36 in the RV (another '710 setup) and still use it with a tablet while driving. Using the Aux input on the vehicle audio system, it all sounds great. Yup, I like toys.

Since we're hijacking the thread anyway (now renamed), I presume that the audio is passed via wifi (hopefully via USB too, later)? I guess we'll find out.

Rick, WA6NHC

How is the thread being hijacked when a part of *your* OP specifically asked about GPS functionality (does it work with the main database or just FLs)?

Concerning wanting to "look ahead" when traveling, I fully understand your point. Just remember that the county's range will cover your looking ahead in most cases. The only time your advance notice using x number of range miles looking ahead would be "better" than my zero mile notice would be if a negative event happened within about 5 miles of the county line, and while it's possible, what are the chances? Remember that even with a zero mile range setting, the county will still go active as soon as I hit it, or even before as long as it's correctly set up in the Radio Reference database. My argument for the zero mile range setting is that I am going to know that all of the transmissions are somewhere around me jurisdiction wise rather than hearing transmissions where I don't have a clue if they are 10 miles around or 100 miles around. That's the beauty of the choice since there is really no absolute correct answer, but rather what works best for us the users.

Siren commentary;

It's VAPORWARE! And until it is on the shelf that's all it is... Promised in the first quarter of 2014, then delayed maybe a month, then again... It's almost the end of the second quarter and still nothing but a promise. But wait, an avatar has been changed! This might mean we should be seeing the app soon! My take on that is that Uniden has a gag order on the issue-no discussion of the problem and Mr. Opitz has created a method whereby he can claim plausible deniability, changing an avatar, which in the past has signaled movement on a product that he can deny if called on the carpet for. That's my commentary.

1011. Siren App and taking ownership

Yahoo group: BCD536HP
Date: 2014-08-05 19:13:43 UTC
From: Rick Bates, WA6NHC
Topic: 1011 Message: 1011

I've started a new thread from this so it'll be easier to follow.

From the reading I've done (here and elsewhere), it's the dongle software that is the issue. The driver etc. will be proprietary information to that part supplier, not open source. Open source would have to be reverse engineered and would run afoul of many obstacles, some legal.

Once the hardware is proven reliable, we'll hear from UpMan about the Siren app. Until then, we wait.... and wait... and ...

My opinion: This should have been fleshed out long BEFORE release of the 536. It makes the release appear premature (90% functional when you consider no Analyze feature too). A minimum of 30 day increments on firmware releases from the dongle supplier is NOT being a responsive (or trustworthy, reliable, fill in your adjective) supplier. The supplier is hurting Uniden (in sales and reputation) and frankly Uniden should be looking for a replacement dongle from a more reputable company, which means a recall of the existing dongle. The alternative is a Uniden supplied rebate for the dongle (ok, they'd probably issue credit vouchers towards the next purchase) which does further damage to the reputation and profit margin; a no win scenario (bad for the company, bad for the consumer).

I sincerely hope that the lessons learned here will be given proper attention on the next project.

* If you cannot fully provide the feature, don't mention it in the first place.
* It's better to add 'new, improved, updated or added' feature(s) after release than give out an incomplete product. (You say it's there, it better be there.)
* Make extra darn SURE your supplier can do what they say they will; keep their feet to the coals until they meet their promise. Keep options open for other (re)sources.

I score this as a mixed fault issue, Uniden and their supplier. While not necessarily a deal breaker to most folks, it does leave a foul taste to not have wifi, Siren and Analyze fully functioning in the original release or after almost a year passed now and the promotion as a major sales point.

1013. GPS and the x36 location "filter"

Yahoo group: BCD536HP
Date: 2014-08-05 23:35:48 UTC
From: Rick Bates, WA6NHC
Topic: 1013 Message: 1013

Hi all,

I'm still trying to wrap my head around DMA programming after a good many years of 'normal' scanning (way back to the Regency 10 channel crystal scanners of the 70's, more recently with the GRE Pro-xx96). I'm new to DMA programming, please be gentle on me. ;o)

So far all the programming of my new 536 is done via the Sentinel software; it's too complicated for a noob to do otherwise. Even things that should be simple (adding a P25 network that is not in the database), is not. Then there are subtleties like when I added a list of ham repeaters yet it wouldn't scan (yup, Ham was disabled in Services, DOH!)... A lot going on here.

For my home/local traffic, no issues. I made up several favorite lists for my usual places to listen (one fire, one cops, one forest, etc). It's simple to add/drop lists as needed. I got that far on my own and it feels pretty familiar.

However, I also travel (because I can). I want to hear select services ONLY while traveling and I don't want to take the time to do an area survey to see what's there. For example, I want the closest parks (state and Fed), the highway patrol/sheriff, any close by fire department (includes the forest service in many states) and NOT hear most other things (no railroads, planes, medical).

But I'm finding that leaving the database wide open adds FAR too much 'shtuff". Dialing it down to what appears to be my essentials is still too broad. If for example I leave Public Safety toggled on, I hear park admin, VA hospitals and other things I don't care to hear. I spend most of the first hour, pressing the Avoid button.

So how do you dial it down to a specific few things while distance traveling (using a GPS to locate you)? [I'm also hoping that responses provide the archive enough for later searching for other noobs.]

It appears that the easiest/best way is to create a state specific favorite file for travel and draw that into action when I near or cross state lines. But then I'd have to add every county/parish/borough that I expect to be in/near. Tedious and I don't know EVERY county in EVERY state so I'd have to look them up. More than likely, I'd miss something I'd want to hear because I have no local knowledge. A few states simply aren't all that large too.

All that data is in the radio, how to make use of it the most efficiently as possible?

So with this in mind, what are y'all doing? Parks, fire (forestry), LE...

The GPS is functioning and providing ongoing data to the 536 (confirmed via the location readout), location for favorites on; full database on, services selected (rather broad categories, which is the real issue).

Goals: to be aware of emergencies going on around me (say within 30 miles; I'm retired fire, still need to know things); hearing LE gives me a flavor of the issues in an area (lot of domestic abuse, drug arrests, drunk arrests, where's the traffic issues). The park

channels (since I am now a wildlife photographer) also tell me where the 'critter' jams are so I can respond accordingly (another bison or elk, yawn; bear or moose, I'll be right there; sometimes stupid human tricks are amusing to hear about "He did WHAT!?!?!?"). It also helps to avoid, um, excessive partying, accidents or (to some extent) other human situations happening in an area (I go to the parks to be in nature or else I'd move to a city).

I'm fluent in firehouse, LE, medic, geek and some other languages but the lack of how to info in the manual is frustrating. It's good for telling you what is there to use; but vague to fully lacking in when to apply it. There are enough features that it's hard to see a path through this forest. And each path has a lot of ways (too many) to get there...

Travelers: Whatcha'll doing to make it work for you?

TIA es 73,
Rick, WA6NHC

Lots of content there. As a quick first reply, I would suggest using the GPS and the main database with your range set to 0, and make a statewide FL to supplement with coordinates set to the middle of the state with an incredibly large coverage range set. That way, your GPS would still select them anywhere is the state.

1015. Re: [BCD536HP] GPS and the x36 location "filter"

Yahoo group: BCD536HP
Date: 2014-08-06 01:00:45 UTC
From: N1CHU
Topic: 1013 Message: 1015

Your post is dead on. I too do a little traveling and have run into the same issues. Granted, the radio has the data and can sift out much of what we don't want but not all. Creating the FL is my way of capturing only what I want. The way to do this is to ask those who know the areas you are traveling through. To this end, I've emailed various state scanner sites. For example, for the state of Ct. there is Connscan. (Spelling may be wrong). each state has a users group and within that users group there are compiled files that you may find helpful. You still need to assemble your FL but the local guys are the ones who give you the "personality" of systems that Radioreference lists. I find that is an accurate way of getting that scanner to become "one" with your trip.

On Aug 5, 2014, at 7:35 PM, "'Rick Bates, WA6NHC' HappyMoosePhoto@... [BCD536HP]" <BCD536HP@yahoogroups.com> wrote:

Hi all,

I'm still trying to wrap my head around DMA programming after a good many years of 'normal' scanning (way back to the Regency 10 channel crystal scanners of the 70's, more recently with the GRE Pro-xx96). I'm new to DMA programming, please be gentle on me. ;o)

So far all the programming of my new 536 is done via the Sentinel software; it's too complicated for a noob to do otherwise. Even things that should be simple (adding a P25 network that is not in the database), is not. Then there are subtleties like when I added a list of ham repeaters yet it wouldn't scan (yup, Ham was disabled in Services, DOH!)... A lot going on here.

For my home/local traffic, no issues. I made up several favorite lists for my usual places to listen (one fire, one cops, one forest, etc). It's simple to add/drop lists as needed. I got that far on my own and it feels pretty familiar.

However, I also travel (because I can). I want to hear select services ONLY while traveling and I don't want to take the time to do an area survey to see what's there. For example, I want the closest parks (state and Fed), the highway patrol/sheriff, any close by fire department (includes the forest service in many states) and NOT hear most other things (no railroads, planes, medical).

But I'm finding that leaving the database wide open adds FAR too much 'shtuff". Dialing it down to what appears to be my essentials is still too broad. If for example I leave Public Safety toggled on, I hear park admin, VA hospitals and other things I don't care to hear. I spend most of the first hour, pressing the Avoid button.

So how do you dial it down to a specific few things while distance traveling (using a GPS to locate you)? [I'm also hoping that responses provide the archive enough for later searching for other noobs.]

It appears that the easiest/best way is to create a state specific favorite file for travel and draw that into action when I near or cross state lines. But then I'd have to add every county/parish/borough that I expect to be in/near. Tedious and I don't know EVERY county in

EVERY state so I'd have to look them up. More than likely, I'd miss something I'd want to hear because I have no local knowledge. A few states simply aren't all that large too.

All that data is in the radio, how to make use of it the most efficiently as possible?

So with this in mind, what are y'all doing? Parks, fire (forestry), LE...

The GPS is functioning and providing ongoing data to the 536 (confirmed via the location readout), location for favorites on; full database on, services selected (rather broad categories, which is the real issue).

Goals: to be aware of emergencies going on around me (say within 30 miles; I'm retired fire, still need to know things); hearing LE gives me a flavor of the issues in an area (lot of domestic abuse, drug arrests, drunk arrests, where's the traffic issues). The park channels (since I am now a wildlife photographer) also tell me where the 'critter' jams are so I can respond accordingly (another bison or elk, yawn; bear or moose, I'll be right there; sometimes stupid human tricks are amusing to hear about "He did WHAT!?!?!?"). It also helps to avoid, um, excessive partying, accidents or (to some extent) other human situations happening in an area (I go to the parks to be in nature or else I'd move to a city).

I'm fluent in firehouse, LE, medic, geek and some other languages but the lack of how to info in the manual is frustrating. It's good for telling you what is there to use; but vague to fully lacking in when to apply it. There are enough features that it's hard to see a path through this forest. And each path has a lot of ways (too many) to get there...

Travelers: Whatcha'll doing to make it work for you?

TIA es 73,
Rick, WA6NHC

I've started a new thread from this so it'll be easier to follow.

From the reading I've done (here and elsewhere), it's the dongle software that is the issue. The driver etc. will be proprietary information to that part supplier, not open source. Open source would have to be reverse engineered and would run afoul of many obstacles, some legal.

Once the hardware is proven reliable, we'll hear from UpMan about the Siren app. Until then, we wait.... and wait... and ...

My opinion: This should have been fleshed out long BEFORE release of the 536. It makes the release appear premature (90% functional when you consider no Analyze feature too). A minimum of 30 day increments on firmware releases from the dongle supplier is NOT being a responsive (or trustworthy, reliable, fill in your adjective) supplier. The supplier is hurting Uniden (in sales and reputation) and frankly Uniden should be looking for a replacement dongle from a more reputable company, which means a recall of the existing dongle. The alternative is a Uniden supplied rebate for the dongle (ok, they'd probably issue credit vouchers towards the next purchase) which does further damage to the reputation and profit margin; a no win scenario (bad for the company, bad for the consumer).

I sincerely hope that the lessons learned here will be given proper attention on the next project.

* If you cannot fully provide the feature, don't mention it in the first place.
* It's better to add 'new, improved, updated or added' feature(s) after release than give out an incomplete product. (You say it's there, it better be there.)
* Make extra darn SURE your supplier can do what they say they will; keep their feet to the coals until they meet their promise. Keep options open for other (re)sources.

I score this as a mixed fault issue, Uniden and their supplier. While not necessarily a deal breaker to most folks, it does leave a foul taste to not have wifi, Siren and Analyze fully functioning in the original release or after almost a year passed now and the promotion as a major sales point.

Rick, WA6NHC

What is it - do they just have their heads in the sand or do they simply no longer care? I do like my 536 but I bought it instead much less expensive models just because of the WiFi. The way I see it, either give me what you advertised or give me back the $150 premium I paid for those features.

Just my opinion, but I think a vendor is responsible to its customer for the performance of its suppliers. If I bought a new Ford and it didn't have a back seat because its subcontractor had failed to deliver I think I would blame Ford and look to them to fix the problem!

>My opinion: This should have been fleshed out long BEFORE release of the 536. It makes the release appear premature (90% functional when you consider no Analyze feature too). A minimum of 30 day increments on firmware releases from the dongle supplier is NOT being a responsive (or trustworthy, reliable, fill in your adjective) supplier. The supplier is hurting Uniden (in sales and reputation) and frankly Uniden should be looking for a replacement dongle from a more reputable company, which means a recall of the existing dongle. The alternative is a Uniden supplied rebate for the dongle (ok, they'd probably issue credit vouchers towards the next purchase) which does further damage to the reputation and profit margin; a no win scenario (bad for the company, bad for the consumer).

1024. GPS on 436

Yahoo group: BCD536HP
Date: 2014-08-07 05:52:19 UTC
From: Rick WA6NHC
Topic: 1024 Message: 1024

Hi all,

I've had the '536 for one week now. I'm looking at adding the '436 to the collection (selling my GRE scanners), but I am not seeing the pin-out for the GPS connector in the manual. Can someone point to what should be obvious please? Pin size, which tip or sleeve is the data in/out...

Thank you,
Rick

Not sure of the pinout but it uses the same cable as all the Uniden portable scanners. Uniden sells a GPS cable that needs no adapters. It plugs right into your GPS's db9 NMEA connection and the scanner (port under the side rubber cover on the 436 beside the USB port).

Or, you can use a dma scanner programming cable with a null modem and gender changer.

Everyone here has made very valid points. But maybe we have one point we are overlooking. That being ++ Uniden packed a lot of New features and new advancements into the x36 models.

In the past when any scanner mfg made advancements it was one feature at a time. For example, the bc210 was I think 20 channels. Then the bc 250 came out and we saw the advance to 50 channels. Later Uniden came out with scanners with pl (tone squelch). We later saw models with two tone signaling. Later again we saw motorola type I trunking. Edacs also.

For the most part we have seen one new feature at a time. In these x36 models Uniden gave us a lot in one big step. Granted, they pitched and sold them based on all the features. But maybe we need to think a bit before we speak. Given our complaints I bet in the future we will see one advance at a time, basically one new feature per year as new models come out. And by doing this we will be forces to buy a scanner when one feature comes out in one model and next year when we see the latest and greatest model we will need to buy another model.

Maybe if we temper our complaints with understanding that the engineers are human and humans can only do so much. Maybe someone made a big mistake and wifi is just not workable with the present hardware (please I am not looking to start any rumors I am just saying maybe). Don't forget we are unidens customers. Uniden must be considering if they burn us they will be giving themself a reputation that can loose them the best customers they have. Unless Uniden plans to abandone the scanner market I doubt they want to burn us.

Let's just be hopeful that the issues with the radios can be fixed. And let's hope that Uniden does not back away from advancements in the future.

Hi Joe!

Actually for a GPS data stream, I'm using a 3 wire 1/8" mini plug coming from one of my ham radios GPS (Kenwood TM-D710a with a Green Light Labs GPS710 attached). Conveniently, both radios want 4800 bps.

Rather than put on a DB-9, then have to adapt it (potential failure point), it would be nicer to just put the proper connector on in the first place.

I'll poke around more. Since it was used before, someone must have the pin out diagram. Even if the plug was proprietary, the pin outs should have been in the manual... or an addendum... or on the website. Yah, I know, I'm a pain some days. ;o) It should have come with the scanner, even if one end had no connector.

Thanks,
Rick wa6nhc

Yes. I listen to many small businesses (simplex and repeater) in my area.

The key is to do digital decoding in real time. The source audio itself can be from a scanner "discriminator tap" or a "Software Defined Radio" (SDR) setup.

For my Mototurbo/DMR (and Icom Nextedge) listening, I use an SDR USB dongle and SDRSHARP/DSD+ on an Windows PC. The SDR is an inexpensive device with an inexpensive crystal oscillator, and therefore, the SDR device needs to be calibrated. Once that's done, it's a stable listening environment, and the audio generated is just as clear and intelligible (some would say even better...sigh) as it would be on a Mototurbo commercial radio.

Best,

Wayne Smith

Well, the pinout on the GPS end is a standard serial connection (lots of pinouts on google), so if you buy that cable you can tear apart the db9 and see what color is what. The Uniden end is semi-proprietary, so you are far better off buying a stock cable. Despite the failure point possibility, I would simply adapt the standard connector to your custom connector, as all GPSs use the db9 for communications.

Oh really??? What are these LOT of "New features and new advancements". I like my x36s, but I'm struggling to remember what's "new" outside of TDMA.
x96XT + HP-1 = current x36.
x96XT + HP-1 + HP-1 Extreme Upgrade = promised x36.

1032. P25 Conventional system problem

Yahoo group: BCD536HP
Date: 2014-08-18 03:13:39 UTC
From: k2sg@...
Topic: 1032 Message: 1032

I posted the below info and question on the BCD436HP forum recently but have not received any reply's. I wonder if anyone on this reflector has some experience with a P25 Conventional system. I have had the opportunity to do more listening the past two days and the problem is worse than I initially thought. Every transmission misses the first work which is very disappointing for otherwise excellent radio.

ORIGINAL POST
I have a local PD that uses a P25 Conventional system. I noticed the first part of most transmissions missing, often the first two words. Following the manual I changed the P25 Waiting Time from the default of 400ms to 0. This definitely helped but the first word or part of the first word is still missing. I am able to listen to the same system using a GRECOM PSR 600 and get each entire transmission. I also reduced the Squelch to 0. Below are the current settings, I would appreciate any suggestions.

Set Hold Time 0
Audio AGC off
P25 wait time 0
P25 Threshold Mode Auto
P25 Threshold Level, I tried both 2 and 0

I have both BCD436HP and BCD536HP and experience the same problem on both.

..Tony

From: Uniden UPMan
Topic: 1032 Message: 1033

Is thayt the only system you are scanning? Does it happen even if you are holding on the channel? Did you program the channel manually, or from the database. If manually, did you set the channel mode to Digital? Do you have any priorities turned on? (Even though Close Call DND doesn't interrupt a transmission in progress, it could result in late channel acquisition as it checks for Close Call hits in between transmissions on channels.)

To: "" <BCD536HP@yahoogroups.com>
Subject: Bad control knob?

I have two 536's. One exhibits a problem when I use the knob to select FL's, or really any menu item that requires you to turn the selector to choose which option you want... It jumps all over the place, not moving up or down to the next selection. It's driving me nuts! Anybody got the same problem? My other 536 is stable. If it's fixable by myself it would save me from having to wait the turn around time if I sent it into Uniden for repair. The radio in question is a mobile install. It's a clean environment, not a commercial application such as a work truck subjected to dirt and dust. If Paul Opitz would care to comment, please advise-should I send it in for repair under warranty? Or is there a quick fix?

1035. Re: [BCD536HP] P25 Conventional system problem

Yahoo group: BCD536HP
Date: 2014-08-18 13:51:11 UTC
From: Robert Torio
Topic: 1032 Message: 1035

I noticed the exact same thing when I bought my 536 last January, doing a side by side comparison with my GRE 800. I posted this issue back then. Of course I shot a call to tech support, and was told that since my P25 system was digital, there were no available adjustments to be made. The other BIG issue I have with this scanner is that it does not follow the talk groups when they are temporarily patched by the agency. Again I discovered this while I was listening to my GRE and 536 side by side. My GRE follows the transmissions seamlessly, and the 536.....nope.....silence. Is it smarter than the Uniden ? Of course tech support told me that they are aware of the problem and are working on a fix...update unknown. So when I want to make sure I am hearing everything for my local PD (Oakland PD), I just turn on my GRE.

Thank you for replying to my help request.
- To remove as many variables as possible I have been using a FL with only the one Conventional P25 Channel of interest.
- The channel is in Hold.
- I downloaded the data directly from Radio Reference using the ARC536 software from BUTEL.
- Priorities and Close Call DND are not turned on.

I may try manually entering the information and see if that makes any difference, getting desperate I guess. Most or all of the first word is constantly missed on the initial transmission.

Topic: 1037 Message: 1041

I have both the 436 and 536 now having just made the move from the GRE line. I'm finding one annoyance so far (well, many but one in particular as I climb the learning curve).

On the 436, you cannot charge the batteries AND run the scanner at the same time via the USB port (the only power source port). You must choose one or the other. For those that like to toss a scanner in the car and go, it can be a game ender, requiring spare set(s) of batteries. If that drive is more than 4-5 hours, the scanner is of no help otherwise.

A higher capacity internal power/charging circuit would be preferable and/or a charging port in addition to the USB port. Options, more is better than one.

I'm not aware of any XT features, but I used the GPS to feed my current (moving) location on a road trip last weekend. Very cool feature. I had better success maxing the range to 50 (should be more) instead of zero.

The self-locating mode using P25 was less successful because it only 'found' a couple systems in the area (there are several) so it was either one county off (pretty close) or 100 miles away.

Rick, WA6NHC

iPad = small keypad = typos = sorry ;-)

There is an old saying... You can't get blood from a stone.

USB spec is only 500 mA, so you have to choose how to use that current - charging or operating. The reason you can't do both is because not all USB ports can supply enough current to do both. Now, they may have been able to detect the current capability somehow, but I'm not sure that would be reliable. Personally, I use apple bricks to power devices, so I have about 2000 mA to play with, but most ports don't.

If you start with charged cells, and power the scanner while mobile, you should not need to operate and charge at the same time. In fact, the intermittent charging might damage the cells.

Besides, charging in the scanner isn't good on the cells anyway (in any model currently made).

Yes, it draws 1/2 amp (500ma) during use, the official limit of most USB ports. Some hubs allow higher current by adding a wall wart supply.

I also use the higher wattage (iPad, 12.5 watt) charging cubes or mobile adapters. The device can sense the high current ability by a resistor across a couple of the pins (only high current chargers have this). [Standard USB chargers cannot charge an iPad while in use and is bloody slow when not used.]

It's sad that they didn't make a workaround for mobile (or bedside, whatever) use without the required downtime (14 hours) to charge the batteries. It would have been possible simply by requiring the high current cubes (or similar) with the caveat that if the USB port was not high current it wouldn't charge.

Most scanner heads I know would want to do both at the same time, charge and use.

1044. Warranty repair BCD536HP

Yahoo group: BCD536HP
Date: 2014-08-23 09:57:35 UTC
From: n1chu@...
Topic: 1044 Message: 1044

I just returned my BCD536HP for repair of what I think may be a faulty function control. When in menu mode, the large left knob is used to select which available option you want. When I turn the knob to select the next option the radio "jumps" to a different location in the list of available choices. Turning the knob in either direction gets the same unwanted results. Getting the option I want is a real bear! As I own two 536's, I compared the function. My other 536 works just fine, moving to the next listed choice when I turn the function selector knob. So I determined I had a bad component and sent it in to Uniden Repair. Uniden sent me a RMA, so shipping the radio via UPS was paid for by them but since I didn't have packing material I asked UPS to box the radio. That cost me $15. (If I had purchased the box, tape and popcorn or bubble wrap from them and boxed it myself it would have cost about the same but then I would have packing supplies for the next time I needed to ship something, minus a box, I decided not to go that route however.) So it cost me $15 total. I explain the extra expense just as an addition for those who also need to use this repair process. It has nothing to do with what ails my scanner. Has anyone else experienced the same problem with the function knob? Bill

I've seen it before, but not on something so new. My guess would be
failure of a led or pickup, or dirt between the two (unlikely for a new unit).

Ok. I haven't seen this particular issue before but the radio also exhibits another questionable ideosinkrosy. I have a favorites list with only the aero freqs (AM mode) of my local airport. While plane spotting just outside the airport I scanned only this list. The audio would start off with a lower volume level but increase in volume the longer the transmission was present. I thought it was some setting or configuration I messed up on, causing this to happen so I did not mention this in my description note accompanying the radio when I sent it back. I should have. But maybe it's only as I first assumed, a bad configuration.... Or a bad radio all around. Maybe they will replace the radio with another refurbished like new unit in their interest of the short 2 or 3 day turnaround time period they claim. Time will tell.

1049. Alert Light

Yahoo group: BCD536HP
Date: 2014-08-31 16:46:28 UTC
From: Scott Jacobs
Topic: 1049 Message: 1049

This Digital P25 scanner is a favorite , decodes out TRS just fine, the one thing I can't figure out is how to enable the multi-color alert light for certain freqs and TGs, I thought It could be done manually(editing) via front panel?

How are other owners activating it?

Thanks, Scotty

From: Jim Stein
Topic: 1049 Message: 1052

Easy to do using the Sentinel software. After you set up a Favorite go to Edit Favorite select frequency or TGID you want and you should see an Alert Light column. Default id Off - just use the pull-down to select a Alert Color and a Alert Pattern.

You can do the same thing manually:
Manage Favorites
Select Favorite
Review/Edit System
Highlight chosen System
Edit Department
Edit Channel
Set Alert
Set Alert Light
Scroll to select color

IMHOP, a lot easier to use the software.

Okay this worked for me ,Thanks Joe & Jim for the instructions, I did it manually , the only thing I've done via sentinel is update the database lol, still not up to speed with software.

1054. Bad favorites list

Yahoo group: BCD536HP
Date: 2014-09-03 11:38:34 UTC
From: N1CHU
Topic: 1054 Message: 1054

I thought that before I delve into the manual I would ask here about my loosing the ability to use one of my favorites lists. The display reads "Nothing to scan". But the list looks ok when I go into the Manage Favorites Lists menu. Plenty of frequencies (and different types of systems) that are not locked out. And the entire list is not avoided. So I am using another list, meaning it's only the one list that's not working. I have two 536's, both SD Cards loaded identically but sent one back to have an unrelated issue corrected and await its return. (Uniden says to return the scanner WITH the SD card). It should show up by the end of the week and I can then swap SD cards if Uniden repair hasn't wiped it. I'm suspecting a corrupted SD card. So it may be corrupted (instead of some setting I may have inadvertently programmed). But if it's a setting, and the card did not get corrupted, I'd like to know which setting I programmed so it doesn't happen again.

This problem occurred in my mobile setup. Its somewhat unique. I never turn off my radios in the console. Instead, I installed an automatic timed power supply switch. 2 minutes after I shut down the vehicle the power is divorced from the console and when I start the vehicle, the automatic power supply senses and restores power. The 536 loads the memory from the SD card and boots normally. This might be the cause of a corruption as Uniden advises to use the on/off function on the radio to do this. But all I have noticed is the need to manually turn off the radio when I have made a change to the programming-divorcing power from the radio won't let it write to the SD card that which I have changed, so I make sure that after any changes made, I let it write them to the card by turning it off manually. If this is the cause, it's only happened this once (so far) since I got the scanner (my order was one of the first to ship the beginning of this year).

Has anyone had the same issue? If not a corrupted card, what setting(s) might I have overlooked when attempting to get the favorites list to function properly?

Bill

On the scan issue, are all programmed quick keys active?

Yes, the cut-off of the power could cause corruption
if the scanner is writing the card at the time its cut-off.

Does not sound like a corrupted card.

I'd check:
1) Are the service types used in the FL enabled?
2) Is the FL set to be monitored? (MENU --> Set Scan Selection --> Select Lists to Monitor)
3) Is the FLQK enabled?
4) Are the SQK/DQKs for the system(s) in the FL enabled?

From: k2sg@...
Topic: 1032 Message: 1057

I received a couple of emails from others who have experienced the same problem with a Conventional P25 system in that the first word was not being heard.

Approximately one week ago I called Uniden Customer service and explained my problem and requested assistance. The gentlemen who answered the telephone was very polite and pleasant to talk too although I was on hold for 48 minutes waiting my turn. We went over a list of things that could potentially cause the problem and eliminated them through various checks. After exhausting all the various possibilities he decided this was a problem for their IT department and took my contact information. He said they would be contacting me at some time in the future. I haven't heard from them yet but will report back when there is some progress and answer to the P25 problem.

I now wish I had not sold my GRECOM PSR500 which worked with my local P25 Conventional system just fine. I really like both the BCD536 and BCD436 so I hope this issue can be resolved with a software update.

Thanks. Don't know how I had set SQK's to "OFF" but once set to "ON" the FL in question came back to life. Is there a command that globally turns to "OFF" all the SQK's in just one FL at a time? If so, I must have done that.

No such command unless they are all set to the same
number. Then they would all disable at the same time.

Joe M,

Your reply "Yes, the cut-off of the power could cause corruption
if the scanner is writing the card at the time its cut-off. "...

Correct me if I'm wrong, but my understanding about my possibly causing the SD card to corrupt... Is as follows...

When a settings change is made to the scanner manually, (not using programming software) the change is written to volatile memory initially and then transferred to the SD card when the scanner is turned off. We see that happening each time we manually turn off the radio, the display informing us of that write to the SD card before shutdown.

The distinction I'm trying to make here is that the scanner does not write to the card, any changes made until it is turned off using the on/off knob. If I got your meaning correctly, you imply the scanner might routinely update the SD card periodically while remaining on.

It's just a minor point, and not related directly to my issue if I am correct. If I am not, and you are, it ...IS... directly related. And that is what I would need to be aware of if I continue to use the automatic power divorcing switch.

For now, I found Paul's suggested settings to check have corrected my issue, raising the question of how I may have made these changes (and saved them) when I did not manually turn off the scanner after making said changes, letting the auto switch kill power without backing up the changes to the SD card. That's what caused me to suspect a corruption issue.

Bill

Thanks for the suggestions Joe. I downloaded all the data direct from RR and compared it manually as well, it's all correct. During the customer service call we also went over all those settings just to check them again and everything seems to be as it should.

Another suggestion sent direct was to check the battery save function and that is set to off in the BCD436. Unfortunately the problem of missing the first word is also occurring in the BCD536 as well.

Appreciate all the suggestions.

I don't think its directly related to your issue, and if the QK setting fixed your issue, that proves it.

But, the scanner ones write to the sd card when receiving, and if te power is cut in the middle
of a transmission, it is possible for it to cause corruption. Maybe not likely, but possible.

I believe you are correct about any keypad operations being written only on power-down.

Ok, understood the scanner could be writing to or reading from the SD card without manually shutting down. Possibly due to GPS settings, the scanner's need to access data called for while traveling. So in that case, the auto shutdown could coincide with the scanners need to access the card. Paul didn't think that was the case but I was calling what happened a possible "corrupting" of the card when instead, it could just be an interrupted random attempt to write or read that caused a bad parity reading or error check which dumped and got disregarded.

From: N1CHU
Topic: 1032 Message: 1069

I don't know. As I have never had the need to search for NAC's, probably never will. My searching days have been over since the Blue Angels and Thunderbirds freq hunts! And here we were looking for what we thought were discrete frequencies and when found, holding them very close, not letting them out to anyone outside of the group for fear listening to the comms was illegal! Talk about being uninformed!

Today, if I can't find it on RR I don't bother. And the close call feature takes care of those incidents I roll up on when traveling.

And just to clarify, I don't think that's what caused the issue you had either. I'm just saying that removal of all power at any time *could* cues an issue down the road.

Try NAC Search and see if that helps the first word
cutoff issue. Note: NAC search, not frequency search.
Set the channel as digital and for the NAC set it to search,
Or set NAC Search in Sentinel for that channels audio option.

1072. Front-end Question

Yahoo group: BCD536HP
Date: 2014-09-05 20:58:12 UTC
From: dobie@...
Topic: 1072 Message: 1072

I have a Larsen 150/400/800 antenna about a foot or so from my Diamond NR770HB antenna on my vehicle. The front-end on my GRECOM PSR-800 is pretty much useless for anything analog now, unless it's close to the transmitter/tower, although it still works for digital reception. I usually use only 10 watts, sometimes 25, in my 2-meter mobile rig and I need the scanner for work.

So, does anyone know if this scanner will work for me, or should I await something with a more robust front-end?

73,

Richard NW7OR

Joe, thanks again for the suggestions. The channel is set for digital and the NAC is as listed in RR. Have not tried NAC search yet, will give it a try.

Also found I have two other PD's that I might be able to hear that use P25 one frequency. When I can make the time I will try give them a try too.

Hello,
I am inquiring about the process to connect my GPS to my 536 scanner. I physically can connect it but there seems to be an issue as I cannot get it to auto locate in the field. Also, I have gone to Sentinel and clicked on yes on all my favorites which is not too many. I called Uniden yesterday and the person I talked to told me I should have the stock antenna connected as well even with the GPS connected and it says on the unit that it's there. I am not understanding why that antenna is necessary as I have seen a You Tube video saying nothing about that. What I need is step by step help with the Sentinel settings and the unit settings. Can anyone help me make this unit a better experience by helping with this information?? All help is gratefully appreciated.

Auto locate is a feature that is unrelated to gps operation, and does require the scanner antenna.

To use location control on your FLs, you must have the location control enabled and coordinates set on your FLs. Location control is in the options tab in Sentinel when you edit a FL. The coordinates are set at the Department level in the Location tab.

If the scanner displays GPS, then it is getting your current location from from the GPS and will automatically select channels based on your location and other selection criteria (service types, enabled favorites lists or main database, etc). Your physical connection is fine

You do need an antenna connected to the BNC connector on the scanner to pick up radio signals. The GPS accessory does not receive those signals, only GPS signals.

How did you create your Favorites Lists(s)? If you entered them manually, did you include locations/ranges for each site and department? (This information is automatically included if you use the main database to make your Favorites List(s).)

From: Rick WA6NHC
Topic: 1076 Message: 1080

Tom,

I am a new user and this is a bit confusing; a how to manual would help, a LOT. The first issue is finding a GPS that speaks in serial format since most currently sold are USB only. It is unclear if a USB GPS will ever be supported (would be great). In my case, I have a GPS attached to some ham gear for vehicle tracking (APRS). That GPS has a second output, serial format, which I feed into the scanner (have both portable and desktop). You apparently have a serial GPS, great news.

Auto locate is not dependent on the GPS (it's ignored if found), it searches for a P25 network then compares the info it finds on that system to the database, making the best guess for location. If you're able to hear long distances from your current location (I can) it may guess wrong (no, I'm not in San Francisco, I'm 100 air miles east). For auto-locate, you will need the antenna attached so it can find a P25 system.

The GPS mode is used when you are drawing data from the ENTIRE database (location setting is ALWAYS on) and for your selected Favorites (those actively in use) with Location setting ON. It's that simple, but the manual can be confusing for noobs, so re-read that last line again. Location must be ON (Favorites) or use the full database (location always on) for automatic, continuous (re)programming as you move about.

Set your range as required; your first line of defense for hearing TOO much. ;o)

If you use the FULL database, you likely want to be selective in what you want to hear. You do this (enable ALL systems in the database) by selecting service types in the menu (NOT in the database). If you do NOT do this, you'll hear far more than you want (wireless mics, really?).

This is confusing, leave the service types in the database wide open (all you EVER want to hear) but find the service type selection IN THE MENU and do your limiting (filtering) there.

Then you're good to go.

Hint: I want my 'baseline' favorites on all the time when I'm near home, so I leave location setting OFF (meaning it's always being scanned when I select it). Other favorite lists can vary so I turn the location setting on for them.

It's confusing, so good luck.

1081. Programming question

Yahoo group: BCD536HP
Date: 2014-10-15 11:05:22 UTC
From: N1CHU
Topic: 1081 Message: 1081

I tried to manually create a new FL but the receiver would not see the new FL when I tried to scan. I know I did not assign the new FL a parameter that is necessary. Since I was in a rush, not to mention, in the field without access to a manual, I tried to program from my memory knowing full well I didn't stand a chance due to suffering from CRS! But I tried it anyways. No Joy. So I was hoping someone could help reinforce my retention skills by supplying that parameter I missed. I find writing about it helps me remember, as opposed to researching the manual. Any help is appreciated.

In order of likelihood:

1. Are the applicable Service Types enabled?

2. Are all programmed Quick Keys enabled?

3. Have you enabled that FL in the scan selection (menu / set scan selection)?

From: tom kosner
Topic: 1076 Message: 1083

Thanks Ric for you advice and I will day that the Uniden BC-GPSK serial receiver is what I have and is connected to the serial port on the back of my 536HP, no USB. Got it on Amazon for about $70. I will take your advice and that of UpMan and I think with all that info, I will be good. Thanks again.

On Tuesday, October 14, 2014 8:00 PM, "Rick WA6NHC HappyMoosePhoto@... [BCD536HP]" <BCD536HP@yahoogroups.com> wrote:

Tom,

I am a new user and this is a bit confusing; a how to manual would help, a LOT. The first issue is finding a GPS that speaks in serial format since most currently sold are USB only. It is unclear if a USB GPS will ever be supported (would be great). In my case, I have a GPS attached to some ham gear for vehicle tracking (APRS). That GPS has a second output, serial format, which I feed into the scanner (have both portable and desktop). You apparently have a serial GPS, great news.

Auto locate is not dependent on the GPS (it's ignored if found), it searches for a P25 network then compares the info it finds on that system to the database, making the best guess for location. If you're able to hear long distances from your current location (I can) it may guess wrong (no, I'm not in San Francisco, I'm 100 air miles east). For auto-locate, you will need the antenna attached so it can find a P25 system.

The GPS mode is used when you are drawing data from the ENTIRE database (location setting is ALWAYS on) and for your selected Favorites (those actively in use) with Location setting ON. It's that simple, but the manual can be confusing for noobs, so re-read that last line again. Location must be ON (Favorites) or use the full database (location always on) for automatic, continuous (re)programming as you move about.

Set your range as required; your first line of defense for hearing TOO much. ;o)

If you use the FULL database, you likely want to be selective in what you want to hear. You do this (enable ALL systems in the database) by selecting service types in the menu (NOT in the database). If you do NOT do this, you'll hear far more than you want (wireless mics, really?).

This is confusing, leave the service types in the database wide open (all you EVER want to hear) but find the service type selection IN THE MENU and do your limiting (filtering) there.

Then you're good to go.

Hint: I want my 'baseline' favorites on all the time when I'm near home, so I leave location setting OFF (meaning it's always being scanned when I select it). Other favorite lists can vary so I turn the location setting on for them.

It's confusing, so good luck.

Sounds like they have some beta firmware out there -- has anyone tried requesting the firmware to see whether the "in-the-field" results line up with the "factory" testing?

Since not every home network is the same as an Enterprise network, and it's not exactly clear how they are doing their lab testing for performance, it might be useful data to have the community provide the feedback.
Uniden really has nothing to lose if they share the beta software because the wifi is useless as it stands already.

I also believe that there are those here that could objectively evaluate the performance and provide some real-world experience in a constructive way. Not everyone can or will comment in a positive way, I would just just hope that anyone working with BETA software would recognize that and act accordingly.

Instead of flaming the vendor all the time, we could offer them support. I also imagine there might be more than a few people here that have the technical wherewithall to assist.

For what it's worth, I still enjoy this scanner over the prior ones I've owned from Uniden, and would buy it again, whether or not Siren App or equivalent was available.

My read on the Upman RR forum post is that they are in house with the beta and are checking the core concerns. So supplying it to a bunch of beta testers (us guys) is not necessary. If they like it they will send it on to Apple Apps. They estimate it takes about two weeks for Apple to add it to the store. Now, my impression is that UNIDEN won't be holding on to it very long- just long enough to assure its not going to blink out after 15 minutes like the last beta. Once UNIDEN sees a solid connect it's off to Apple. But Upman stresses "IF"... If UNIDEN doesn't like the beta it's back to the drawing board.

Once it reaches Apple it will be offered in a limited capacity state with updates to follow (dongle firmware, etc). Or, in other words, some features won't be available at the initial introduction level but follow later.

I would expect Upman's next post will be to inform us which way they send the beta-to Apple or back to the creators for repair. If the time period between the first beta, which was sent back, the second beta, which was better but still not acceptable and sent back, and the current beta is any indication, we would be looking at another 2-3 months if it also is sent back.

So here's hoping this beta goes forward to Apple.

1089. Turning my BCD536HP on/off using a timer

Yahoo group: BCD536HP
Date: 2014-10-16 11:41:25 UTC
From: n1chu@...
Topic: 1089 Message: 1089

I have a radio console with the BCD536HP, a Icom 2828 DStar ham radio, and 2 other ham transcievers that are powered by an inline fuse directly connected to the battery in my truck. This line feeds a timer which divorces power to the console when the ignition is turned off. I've got it set for 2 minutes. When I start my truck the power is automatically reconnected. All radios are left on. I've been running this setup since I installed the 536 back at the beginning of this year without any issues.

Now, I realize I am not allowing the 536 to write to the SD card before it shuts down so any changes I make to the radio are not backed up to the SD card. But simply turning off the radio normally, allowing it to write before it shuts down, and then turning the radio back on, writes to the SD card any changes I do make. I then let the timer take over. So when I start the truck all the radios come on-when I shut off the truck's ignition switch all the radios die after 2 minutes.

I'm submitting this for those who might want to apply the same process. I have heard concerns of the possibility of corrupting the SD card using this method. And Uniden (I expect) would not condone divorcing power using this method because that's not the way they designed the radio-can't say as I blame them either. But my results have been satisfactory. No glitches.

Good question. I doubt that feature is included. My guess-and it's only a guess is that Uniden is anxious to get something, anything, posted to the Apps store, and then supply updates to the core app... So I am expecting only the ability to use my iPhone to listen to my 536, and make programming changes remotely. But for all I know, it may only be one way, listening remotely, without the ability to make changes. But that's a start at least. Remembering that what UNIDEN has now needs to first be accepted, or back it goes!

There is a mod you could make that would make the scanner happy. Connect the scanner to the supply side of the timer (on all the time) and connect the output to the switched side of the power switch. This would require a mod to the scanner, but you could use the orange line on the power cable to make a clean mod. HUGE CAVEAT: I don't know if the switched power on the scanner is 12V or not. If not, you would have to add a relay internal to the scanner.

Just wanted to pass this along in case you wanted a more scanner-friendly solution.

I have both an Android smartphone and tablet and am one of probably many who would be very upset if only Apple products are supported by the long awaited app. Very upset. Having said that, though, I just had a look and can't find any Uniden advertising that specifically says that Android will be supported. Their main website just says "smartphone or tablet" with no reference to platform.

If anyone sees a specific promise of Android support, I would appreciate the seeing the site. I would feel much better seeing this in print instead of my just foolishly assuming that Uniden would do the right thing!

Perhaps UpMan could comment on the supported platforms?

Thanks!

Here is what is on the HRO website:

What's APPening? Uniden's Siren App is the first-ever app that allows you to directly control and listen to your scanner. Connect the BCD536HP in infrastructure mode to your home's wireless access point and access it using your smartphone or tablet from anywhere in your house...or anywhere in the world where you have an internet connection.
Or, set the BCD536HP to operate as an access point, and use your smartphone or tablet as a remote head, even when you are away from other internet connections.
The Uniden Siren app gives you freedom like never before to roam around your house or around the country, while still keeping completely in touch with and in control of your scanner. We are still working on this exciting development, so stay tuned for more information before product release.

Ever thought about using a "ChargeGuard" and set it for a longer time? Seems like that would be the easy solution. I use ChargeGuards for my radios and laptop computer in my vehicle. I don't like the radios powering up and down all the time. Yet, if I am gone too long they will shut down and not kill my battery. Seems like you would want to keep them on longer any way.

Subject: [BCD536HP] Turning my BCD536HP on/off using a timer

> I have a radio console with the BCD536HP, a Icom 2828 DStar ham radio, and 2 other ham transcievers that are powered by an inline fuse directly connected to the battery in my truck. This line feeds a timer which divorces power to the console when the ignition is turned off. I've got it set for 2 minutes. When I start my truck the power is automatically reconnected. All radios are left on. I've been running this setup since I installed the 536 back at the beginning of this year without any issues.
>
>
> Now, I realize I am not allowing the 536 to write to the SD card before it shuts down so any changes I make to the radio are not backed up to the SD card. But simply turning off the radio normally, allowing it to write before it shuts down, and then turning the radio back on, writes to the SD card any changes I do make. I then let the timer take over. So when I start the truck all the radios come on-when I shut off the truck's ignition switch all the radios die after 2 minutes.
>
>
> I'm submitting this for those who might want to apply the same process. I have heard concerns of the possibility of corrupting the SD card using this method. And Uniden (I expect) would not condone divorcing power using this method because that's not the way they designed the radio-can't say as I blame them either. But my results have been satisfactory. No glitches.

The Apple release is coming first, then the Android version. That's according to Paul Optiz. The Apple release with updated WiFi dongle is supposedly available at the Apple store (or whatever they call it). Once they are confident it works, we should see an Android version. I asked a couple of weeks ago, and this is the answer I got.

Here is Upman's latest post dated 9-25...

We were about to start beta testing today, but overnight got two more updates (one to the dongle, and one to the scanner firmware) that added record/playback functionality to the codebase. So, beta will likely start either tomorrow or Monday. If testing shows it to be stable, functional, usable, then we'll have an iPhone app to submit to the Apple App store in a week or so. From what I've heard, it takes up to 2 weeks for an app to be approved to go on-line once it is submitted to the store.

There is a big, huge "IF" in that paragraph, above, which adds a high level of uncertainty to the situation. But, at least the codebase (both in the scanner and app) have been substantially modified now to utilize the alternate access method we had to proceed with, so we should be just running into "normal" bugs, not the complete failure to perform situation we were in under the old methods.

The first rev of the app will still lack some eventual functionality, but core operation will be there.

From: Bill Nolan
Topic: 1110 Message: 1110

Mick,

Your Chargeguard does the same thing as the timer I use. I can set the time before shutdown to different lengths of time but choose not to. My personal choice of 2 minutes suites me fine. You can set yours to whatever you like-It makes no difference to me.

We both had the same objective in mind when installing our devices, not killing the battery if we leave something on by mistake.

But my post has to do with adverse reactions that may or may not occur when divorcing power, simply pulling the plug, instead of manually turning off the radio using the manufacturers recommended method. As I stated... no adverse reactions whatsoever. And I am happy with the need to remember to turn the radio off (while the truck is still running) when I want to save programming changes.

Joe gave you the short answer!

Date: 2014-10-18 10:31:18 UTC
From: N1CHU
Topic: 1089 Message: 1112

Joe,

I had thought about investigating that possibility but didn't like the idea of messing with a new radio, all the while keeping it in the back of my mind, should the radio not like someone just pulling the plug out of the wall! But I lucked out, so no need to do any mods. Thanks for the heads up concerning the radio's on/off switch circuitry voltage... Something I didn't consider. That would have been disastrous.

Now, on to my next project; how to use an IPad mini as an external display for the BCD536HP. I find myself glancing down, trying to read the radio display while driving. Normally, a quick glance and I've got the information. But not so after my Lasik surgery... I need to put reading glasses on. It's all too distracting while driving. I don't care if I need to use a data patch cable either as the IPad mini is dedicated to the truck. But, I don't see any software like Butel that lets me do that with the mini. Maybe there is a Bluetooth solution? Or, when Siren becomes available, I could run that app on the mini and use my cell phone as a hot spot. I have that hotspot now but I believe it's got a limited amount of time before it would be charged as an overage. Any ideas?

Gil,

Oh well, we are stuck with it I guess. But on the bright side, they are working the problems. I think they knew some of the stuff they advertised would take a little more time, but not too much, before they could offer it to us. But, the Siren app really hosed up their projected timeline. And that was something they didn't expect. My gripe with UNIDEN has more to do with the little amount of info forwarded to us, and the needed searching of different sites to get what was available on the current status. And yes, I know Paul Opitz stated when they knew anything, we would know. In retrospect, any ranting I did was probably due to my not finding the correct sites, thinking all I needed to do was hit the UNIDEN website for these updates. Afterwards however, it looks like I didn't have all the facts. Now that I understand the issue I am not as frustrated and don't care to wallow in the past but look forward to the future. And I doubt I would have liked UNIDEN delaying the 536 another year until all the bugs had been discovered and corrected.

Had UNIDEN known they were going to have trouble with the Siren app, I'm sure they would have advertised it that way. But I believe they got blindsided by it.

I find it hard to believe all this time has been spent negotiating with and waiting for outside engineers for the last year. Once they get the hardware resolved than your looking at sometime for fine tuning the Siren app to were it's 100%. And if you waiting for the Analyzer feature, well it has been delayed until the wifi issue is resolved. This sucks if your a 436 owner. Why were these radios released if they were not ready? They would have been better off releasing the HP2 next followed by the x36HP.

Because the "Analyze" features are placed behind the Siren App. Now how much sense does that make???? We're waiting on the completion of a project that Uniden "claims" is the fault of outsiders before we can have a feature controlled by Uniden, and ALREADY IN PLACE in the HP-1.

Actually, my unqualified opinion of this is that it is because something that Uniden is not saying. For anyone who has seen the Analyze features on the HP-1, can any of you picture really being able to fit that into the 536's display. So again, unqualified but still my thought, is that the Siren App will enable "Analyze" to send the resulting display to a computer. I can be 100% wrong, but I still don't see how the 536's screen is large enough for Analyze.

Maybe it's being held up because it too
will use the WiFi for a huge display.

Just because the Extreme functions work on the HP1 dosen't mean it will work in the 536 or 436 which use different hardware....

Because the "Analyze" features are placed behind the Siren App. Now how much sense does that make???? We're waiting on the completion of a project that Uniden "claims" is the fault of outsiders before we can have a feature controlled by Uniden, and ALREADY IN PLACE in the HP-1.

No arguments there. However, my point is that Uniden has already successfully released analyze functions on a previous model. Even if the hardware is different, I would think that “Analyze” is ALL Uniden, and can’t be blamed on some outside vendor not cooperating. I normally like to take a back seat when Uniden bashing comes around, but I am now weary of the silence. Not meant to be a bad reflection on Paul himself, but Uniden is doing a very good job in relaying that they do not care about their current customers when they have a chance to make more money. I sure wish Whistler would hurry up and bring the GRE production back up to speed, competition is good!

I can't think of any, but thinking about the logic, it makes sense. If they have firmware updates that have WiFi features that are not working correctly yet, it makes sense they would not want to release that.

I just bought a Uniden bcd536hp and the audio sounds broken up and intermittent. Using the same antenna my GRE PSR600 and Pro 106 sound perfect. I'm using the simlcast on Montgomery County Maryland fire and police. Is there a setting in the Uniden bcd536hp I might need to adjust? Thanks. Merlin K3MEJ

In my opinion Sentinel isn't a really great piece of software but it will do the basics and is at least satisfactory. It does have one significant advantage over the better software like ProScan and Butel, though, and that is that a direct link to the Radio Reference database is included. At no additional cost, Sentinel downloads and regularly updates the database. In order to use the other software you must pay a subscription fee ($30/year) to Radio Reference for the download. Without the database the 436/536 would be essentially useless! So...stick with Sentinel, at least until you get very, very familiar with programming the 436/536.

Uniden has never been known for bells and whistles, but the SW does
everything you need to (with respect to programming).

As for the x36 being useless without the preloaded data, I rarely use it
and rely on my FLs for scanning 99.99% of the time.

The Siren software was reviewed by Uniden and deemed unacceptable so back it goes yet once again (and apparently until they get it right!). This is the third submission? Maybe fourth, to Uniden and although Uniden says each submission is getting better, it's not quite there yet. I would think whoever is writing the Siren app would know better by now that Uniden isn't going to accept anything short of what they agreed upon at the outset. But they send Uniden a better beta each time, knowing full well it still won't pass inspection. I give it another month from when Uniden rejected the latest offering before Uniden sees a new submission. That's just my guess so don't bet the farm on it!

I'd like to see some updates made to the Sentinel software but it does all that is required. That is probably only the original intent so programmer energies can be spent elsewhere. Perhaps they are leaving improvements to the third party vendors, but those I've tried are still not what I'd like to see.

One of the strongest points is that you can download the entire RR database so if you travel to areas without Internet access, you can still (re)program FL on the fly (or use the entire database and filter by service which is less good, things get missed).

Sentinel:
Needs to be more cohesive, not bringing up sub-apps to do things like set alarms or system changes. It appears to be functions stuck together into one app, some abilities are not intuitive. In this day and age, software MUST be intuitive (the scanner sure isn't). It appears, incomplete.

Needs an improved help file. (This is a general lack in Uniden, the user manual has the exact same issue, hard to read with no how-to or when to apply a given feature.) The bulk of the user 'support' comes from peer groups.

Needs to have a frequency search function (sometimes you may/not have a given frequency in FL). If only to avoid duplication of channels (sometimes in two different lists on RR too).

It needs to be able to PRINT (hard copy, on PAPER) in a usable format so that frequencies, tones, etc can be given to others of the old school that don't have Uniden scanners; or for reference if you're away from your computer.

Needs a simpler means to add frequencies into an FL that are not in the database (like some ham repeaters, THOUSANDS are not included). The current method to add is tedious and slow (name, frequency, mode, tone, service for EVERY entry is required; can't some be grouped together?).

A nice addition would be ability to UPload new data directly to the RR team for inclusion into the RR database. [For the above additions, plus a recent major fire used frequencies NOT in RR but I was able to glean them from the IAP of the fire.]

If they ever remake Sentinel, it would also make sense to allow it to be the Windows version of Siren, to match the iOS/Android flavors.

One thing, on that subject, that is not clear; will Siren pass audio or simply allow control? It would be AWESOME to not have to use another program (and a computer) to pass audio (controlling and HEARING the scanner in the fifth wheel while driving my truck would save a LOT of cab space or listening to the home scanner while on the road).

"News" on the Siren app came out last week. Still in limbo, hurry up and wait; cause unsure; likely the dongle provider (after more than a year?).

Score: Good scanner; mediocre documentation (and I'm fluent in many variations of 'geek-speak'); (merely) adequate software; poor at informing customers on updates or

status (bound by company limitations, I know, NOT an excuse, it should be better than this). Grade: C+, improvement needed when it is considered that Uniden is one of the major players in the scanner market. And that is a short list of players.

Regards,
Rick, WA6NHC

The information provided below is inaccurate. The Siren App itself has progressed just fine and we have had no problems with the app developer. The problems have been with the firmware in the Wi-Fi dongle itself, and we've received many more than 4 updates to that.

Thanks for the clarification Paul.

My intent was not to misinform and my comments, although not totally correct per your post, do have some validity to them. As I, in my mind include both the Siren app and the dongle into the same "not functional" pigeon hole, and keying on your previous comment concerning how long it routinely takes Apple to add an app to their store, I drew an incorrect assumption. My guess on how many attempts the counter has registered, the rejects for dongle software, is moot. The corrective process, in an effort to achieve the level of excellence Uniden needs to see before they submit to the end user should be measured in time instead of how many times it takes to get it right anyway. Not that I don't appreciate the back story (history) of what I'm sure has been quite a headache for Uniden.

Looking forward to your next update.

Bill

I subscribed to this group shortly after it was formed and I’ve been following quite a few topics with interest. Of course, the Siren App is one thing I’d really like to see them finally make available, but that’s not what I’m here to ask about.

I’d like to know what bugs and changes to the 536 haven’t yet been fixed, or resolved in any other manner. I’ve seen a lot of things that weren’t working properly over the months, and can only assume that since they’re no longer being talked about, that they have been resolved, so I’m just curious if there are any problems TODAY with the 536 that might cause me not to buy one just yet. I have a 436 and simply love it. It receives much better than my 396 or 996 (even on the stock antenna vs. rooftop) and seems to handle trunked systems so much more efficiently. The audio is so much clearer as well. I’m ready to replace my two 996’s, but I’ll wait if there’s still issues to be resolved with the 536.

Thanks for any input you can provide.

Part of the issue with the 536 is that Uniden is working on the WiFi issue, and has no doubt incorporated much of the solution into the firmware for the 536. The problem with this is that it they have not definitively solved the WiFi issue, so the firmware cannot pass QA for release, as part of it is still not meeting Uniden's standards (per UPMan, the WiFi issue has been 'sent back' several times without approval).

So, I suspect that when the WiFi issue is resolved, there will be a firmware update that, in addition to resolving the WiFi issue, will have the added benefit of other firmware advancements.

Topic: 1147 Message: 1150

Hey Guys,
I have had my 536 for a few months now and the WiFi issue, although important to some folks, was not an issue to stop me from buying one, it's an additional item, that when working correctly, will be a big benefit. I love my unit and even though I do not get into the finer things this unit will do it's WAAAAY better than the BCD 785 that I had and now someone else is using and happy with it. It works well with the Uniden GPS unit while on the road as well. The Sentinel software is good. It works well for what it is and getting that update every week is a plus. I think you could do a lot worse than buy the 536, it has so much potential for those who dig deeper for what they want to do with it, it has many capabilities that for me are not important but to others it is, so hopefully you will think more about that purchase. No, I don't work for Uniden, I just know what I like and hopefully one day I will master more of the unit.

I’m assuming when you’re talking about WiFi, you’re referring mostly to the issues as they relate to the much anticipated Siren App and being able to use your iPad/iPhone, etc. I’m aware of those issues, as I’ve been watching the emails in this group for a very long time. Some issues were just bugs that needed to be worked out, and as many with the 536 as the 436 seemed to have. As long as I can plug it into the wall, or into 12v in the car, slap an antenna on the roof and monitor local radio traffic, I’ll be happy, although I do eventually want the WiFi/Siren stuff to work. It, too, is a reason that I want the 536 as opposed to a whole fleet of 436’s. There were some bugs early on that I remember being concerned about at the time, and that caused me to purchase the 436 first (which also had its issues).

So, I guess, aside from anything related to the Siren App and the related hardware/firmware issues, are there any potential deal-killers with this radio as it is today? I’m hoping to make a purchase soon, depending on Black Friday and/or Christmas sales, and I’ll probably buy 2 at one time to replace my 996’s.

Ed

Subject: Re: [BCD536HP] What's the latest?

Part of the issue with the 536 is that Uniden is working on the WiFi
issue, and has no doubt incorporated much of the solution into the
firmware for the 536. The problem with this is that it they have not
definitively solved the WiFi issue, so the firmware cannot pass QA for
release, as part of it is still not meeting Uniden's standards (per
UPMan, the WiFi issue has been 'sent back' several times without approval).

So, I suspect that when the WiFi issue is resolved, there will be a
firmware update that, in addition to resolving the WiFi issue, will have
the added benefit of other firmware advancements.

I have for sale an as new Uniden
BCD536HP desktop/mobile scanner. I have only used this scanner for about 1 hour. This is Unidens latest and greatest scanner that does it all by inputting your zip code. This scanner comes with unused telescoping
antenna, DC power adapter, AC adapter,USB cable, three wire harness,
mounting bracket and hardware, unused owners manual and original box. I
am the original non smoking owner of this radio. The plastic is still on the display. This scanner is a 10 out of a 10 functionally and cosmetically.
I will also include in my price a new Nifty Mini Manual for the BCD536HP
I am asking $480 shipped CONUS.
You will not be disappointed.
NO TRADES

I can't think of any, but thinking about the logic, it makes sense. If they have firmware updates that have WiFi features that are not working correctly yet, it makes sense they would not want to release that.

>No arguments there. However, my point is that Uniden has already successfully released analyze functions on a previous model. Even if the hardware is different, I would think that “Analyze” is ALL Uniden, and can’t be blamed on some outside vendor not cooperating. I normally like to take a back seat when Uniden bashing comes around, but I am now weary of the silence. Not meant to be a bad reflection on Paul himself, but Uniden is doing a very good job in relaying that they do not care about their current customers when they have a chance to make more money. I sure wish Whistler would hurry up and bring the GRE production back up to speed, competition is good!

1162. Scanner dying? no audio and backlight

Yahoo group: BCD536HP
Date: 2014-11-20 18:05:35 UTC
From: ws0z@...
Topic: 1162 Message: 1162

So I've had this HP536HP for about 1 month now. It took a bit to get used to how it worked compared to other scanners I've owned. I've been monitoring local systems with no trouble until last evening. Suddenly, I noticed there was no audio coming out of the unit. I used the menu button, which usually beeps at me and rebooted it and eventually it worked again.

This morning I was listening to it and all seemed fine then again I noticed no audio. I hadn't touched the scanner at all. It showed that there was activity on the system I was monitoring, but there was no audio, not even from button presses. I tried to press reply to hear and the only place audio came from was the speaker jack. No internal speaker audio (when headphones disconnected) and no audio from the rear speaker port (which I use an isolated cable on). I rebooted the scanner several times without change. I've unplugged power for 5 minutes and still no change. It seems to be scanning and decoding digital just fine, but the audio is now only available through the headphone jack. Scanner audio and button beeps work fine. Just no audio from internal speaker or external speaker port.

One of the times I rebooted the scanner, the backlight flashed briefly then went off. It otherwise seemed to function (other than audio of course), but no light. It took a few reboots for the backlight to come back on.

Anyone else have similar issues? Is there a fix, or should I just send it back. Kind of an expensive scanner to work for a month then start dying.

Thanks.

The backlight went out again and it took several reboots for it to come on again.

I cleared the user settings from the menu and no change even after rebooting. I then did the 2+9+Dept+power on method of clearing everything and when it powered up audio was back. So far it's working ok. My configuration consists of a whopping 2 favorites lists and no more than 4 systems per list with not even 50 talkgroups total in the favorites lists. That shouldn't have caused the data to get corrupted so fast while sitting there scanning unless there's an underlying problem somewhere. Firmware is: 1.03.03, which is what the scanner came with, in case anyone else has had similar issues.

I know it is a pain to return the unit and wait scanner-less for it to return but I think it is time to bite the bullet and get it properly repaired. I suspect that the problems will only get worse.

I agree, but if the problem isn't currently happening, it may be
difficult for Uniden to properly diagnose it. It also could have been a
one-time CPU glitch. I would see if the problem recurs.

I've been removing power instead of turning the power off using the on/off switch without issue for about a year now... Installed in my truck.

The only time I turn the radio off the recommended way is when I want to write changes I made to the SD card.

I see about 3 cycles of starting/stopping my truck per day. So it figures out to over 1000 times the 536 has been divorced from 12 volt power without incident.

However, the mandatory disclaimer applies... "This is not a recommended manufacturer's choice for turning off the radio. Your results my vary".

Joe,

When I turn the scanner off, I turn the knob until it's in the off position and wait for the screen to be blank before turning it back on. The times I removed power, I turned it off and made sure the screen was blank before removing power, again, trying to prevent potential problems as it wrote to the card.

That's a difference of this scanners from any others I have in that when you turn this one off, it's not off just yet until it finishes playing with the SD card and such. I'm tempted to get a new card and copy the contents as maybe there's a problem with the card, which is a cheap fix. On the other hand, I had no backlight at one point when I tried powering it on without the card to see if it worked that way (trying to isolate corrupt configuration).

1171. Re: [BCD536HP] Scanner dying? no audio and backlight

Yahoo group: BCD536HP

I had the power off and disconnected for 20-30 minutes at one poing only for it to still be without sound when I powered it back on. It wasn't until I cleared settings from the menu (both options were cleared) then via the boot-up clearing method before the sound finally came back this time. So far it's still running, but I've not turned it off since it started working.

Interestingly it's the audio that stops working and not something complex like scanning, decoding talkgroups and user ID or even the serial connection I have to the computer.

A spare card is always nice, and cheap. I don't see that as a card issue since the firmware is in the unit, but I can't say for certain it's not a card issue, either. I would say about 90% it's not the card.

I'll suggest the obvious. Check for:

Firmware update?;
Power supply voltage and current sufficient to the task;
Power on/off by power switch not power outage (hashed mem card);
Try another mem card.

I'd also take a look at other external devices (audio systems, computer) that it is routinely connected with to make sure no external influences.

Lightning lately?

Send it back for repair or just buy another one!

Sent from my iPad

1175. Radio dying?

Yahoo group: BCD536HP
Date: 2014-11-21 11:03:10 UTC
From: N1CHU
Topic: 1175 Message: 1175

Is there a sub group for the BCDx36HP that lists problems... As a reference point to check when you find a deficiency with your scanner?

I had to send one of my two 536's in for repair when, while in the menu mode, using the knob to select which item you want, scrolling down thru the choices, the knob would click once and the menu was supposed to highlight the next item, but it would jump around and highlight another menu choice instead. Uniden fixed it along with another earphone jack concern and sent it back with paperwork that only listed the mod they did to the earphone operation... Not sure exactly what that was all about but it bothered me that the paperwork neglected to mention the repair I had requested, yet the radio was repaired.

So I guess what I'm suggesting is a repair registry that we can watch and learn what issues others have, compiled in one place, instead of reviewing the entire news group, looking for problems.

If I missed an already existing site, sorry. Where can I find it?

Bill

I had the same audio problem.no audio from internal speaker or audio output jack, just from headphone jack. Sent it in for repair under warranty. Came back fixed and within two weeks I had the same problem. Sent it back to Uniden and they replaced the whole unit. Been working fine now for two weeks.keeping my fingers crossed!

You could use the group's DATABASE function to create a database...

1184. Re: Scanner dying? no audio and backlight

Yahoo group: BCD536HP
Date: 2014-11-21 18:29:12 UTC
From: ws0z@...
Topic: 1162 Message: 1184

Thanks for the info Steve. That's pretty much what I expect if I send it in, that they won't see a problem since it's working fine now and they'll just return it to me for it to act up again down the road (hopefully within the warranty period). If your unit has been replaced, hopefully you'll be able to enjoy a fully working scanner.

Another strange thing I've noticed since I got this scanner. When I turn it on, I can turn the knob 5 clicks before it starts adjusting the volume and displaying the volume level on the screen. During this whole fiasco with the audio, I also realized that the volume indicator will dissapear while I'm turning the knob within the 1st 5 clicks nearest Off as if I'm not even turning the knob. Once I get to the point it starts adjusting volume and indicating such, it acts normally upwards and to that point, it's just the first 5 clicks where it doesn't do anything. I wonder if this is "normal" for this model, or if it's another special feature of my unit.
So far the audio is still working fine and no issues since I did the 2+9+Dept power reset yesterday. I've rebooted it a few times to see if it would start acting up again, though the only trouble it had at boot sometimes was the backlight not coming on. We'll see if it acts up again. In a way I hope it does so it can hopefully be fixed or better yet, replaced.

1185. Re: [BCD536HP] Re: Scanner dying? no audio and backlight

That's normal for both volume and squelch.

I suspect Uniden wanted to keep the "traditional positions" of the knobs when compared with older models.

Personally, I would just as soon they started working at the first 'click', but that would be odd for the squelch, as it would mute almost immediately, and some users may find that disconcerting.

There is a U-Tube example of how to program Favorites and add these frequencies and talk groups into the scanner. Start your search engine by entering BCD536HP Perhaps I am a little challenged when it comes to computer operation, but to me it seems to follow far too quickly. Has anyone found a PRINT version for these instructions? I feel that it would be much easier to follow along with the programming steps. Cully KSØD Richfield MN.

n1chu <n1chu@...>

1191. Re: New file uploaded to BCD536HP

Yahoo group: BCD536HP
Date: 2014-11-23 17:18:52 UTC
From: n1chu@...
Topic: 602 Message: 1191

I created this REPAIR file in the hopes that when something requiring Uniden repair is noticed, we can have a listing of them. A quick reference that could put us in touch with the conversation headings that may have previously dealt with the issues. This was realized by myself when someone posted about the volume not increasing until the volume knob was moved up by so many indented increments. (I suspect those indented increments we feel are "feel good" items... put there for our need to notice an advancement of the control we are manipulating, when in fact, there is no mechanical potentiometer?, instead, its all done electronically.)

Of course, this repair list will only be as good as our participation input. But I thought it was worth a shot. Just add another text to it if you have an addition. And if it does not catch on, or there is another place where this information is being compiled, please advise. I will take this one down and add to the pre-existing one.

Thanks,

Bill

Thanks - nice work in setting up this area. I hope that everyone who experiences an issue will post here.
Just a small correction - the link provided errors out as it takes you too deeply into the database. I needed to truncate the URL to:
https://groups.yahoo.com/neo/groups/BCD536HP/files/REPAIRS

Then just click on REPAIRS and the issue title and a download will follow.

...not sure what you meant by "Just a small correction" but understand it was necessary.

So now it's wait and see how many problems get compiled... Which I don't think will be a complete set of issues as I am sure there are those who purchase the scanner with specific needs in mind... and incorporate those needs without asking for advice from a news group. Any problems they may have had or will have in the future are probably dealt with by simply returning the scanner to Uniden. It's unlikely they would have a problem different from any that may get listed here but ya never know!

Bill

Wouldn't the DATABASE be better for this than the FILES section?
I'm not sure how anyone can modify the FILES short of DLing the file,
modifying, and re-ULing the file.

1198. Setup error when updating WiFi dongle

Yahoo group: BCD536HP
Date: 2014-11-27 14:07:27 UTC
From: n1chu@...
Topic: 1198 Message: 1198

I get a Setup Error stating "Not enough storage is available to process this command" when I try to run WindowsInstaller-KB893803-v2-x86.exe.

Followed the instructions in Twiki. This is listed as step 6 in the update process.

Anyone have helpful ideas?

Bill

The process given here to update the WiFi dongle is the most convoluted thing I've ever see. To make matters worse when I do get to the end it asks for a Com port when earlier instructions say to plug the dongle into a USB port. Total garbage.

Maybe it has a converter. Did you even bother to check the Device
Manager to see if a COM port was assigned? (rhetorical question)

I don't know what all Uniden has in mind for the dongle. Certainly interfacing with Siren will be one thing, and I can think of several other possibilities, but I don't know their plans.

Win 8.x is an abortion reminiscent of OS2 for those that have been around. I've used it, cursed it and prefer Win 7. At least I can make things look and run the way *I* want them to.

However, have you tried (in Device Manager) to set the dongle to a lower port value, one that is unused. There may be a conflict in the driver if Win8 tries to use the current port. Don't presume that Win (any flavor) is always right.

In any case, if Uniden ever gets it together, it could be assumed that there would be specific help once the dongle actually becomes useful. It is almost certain that another firmware update will be required to work with the apps or via the LAN.

In the meantime, it simply doesn't matter.

Win 10 comes out RSN, let's hope for better days. ;o)

1210. Erase recordings not working?

Yahoo group: BCD536HP
Date: 2014-12-09 17:15:52 UTC
From: vwjettapilot03@...
Topic: 1210 Message: 1210

Sometimes I use the record feature on my 536, to record what happens over the radio at my job. I leave the scanner at home recording and if there wasn't anything extraordinary, when I come back home, I stop the recording. Then the radio tells me I have "x" amount of audio files and if I want to save them.

I choose not to save them, click no, but yet, when I go into the replay options, the audio files are there. Even after cycling the radio off and on. So I connected the radio to my laptop, without launching Sentinel, wanting the PC to see what was on the SD card.

To my surprise, there were a crap load of audio files still there from the time I purchased the scanner!

Is this normal behavior for the scanner?

I thought that the scanner would delete all unheard audio files when specifically told so.

Anyone knows why is this?

1211. Re: [BCD536HP] Erase recordings not working?

What you are doing is not saving the most recent recording. When the scanner records 100 clips, it saves the file and starts a new recording. What you are seeing is the status on the most recent recording (saying you have X audio files, or more accurately audio clips.

what you are seeing is normal operation.

Are you talking about the continuos recording the scanner does for the "Replay" feature?

Because that is not what I'm doing. I'm specifying the scanner to record from start to stop. I am aware the scanner continuously records at specified intervals. I saw those files when using the laptop, but didn't mess with them.

1213. Re: [BCD536HP] Re: Erase recordings not working?

Assuming you are replying to my post...

Yes, I'm talking about the RECORD feature you are using.

REPLAY continually overwrites the same files. RECORD creates files for every 100 audio clips it records (unless you stop it before it reaches 100 clips). You are only "not saving" the most recent file. When it's telling you that you have say 63 files, that means 63 audio clips in the most recent file. When you reply NO to saving them, you are only deleting that 1 file with the 63 clips.

If it is only deleting the most recent file, what happens to the others? Wouldn't this be a bug? As I said before, I went into the sd card and found multiple files, some dating back to two months ago when I first purchased the scanner, a few hundreds of Mb's. I'm not worried about running out of space, as I have a 12Gb card in the scanner. But I like tidiness and don't like to keep extra useless stuff laying around in memory.

1216. First Year Anniversary

Date: 2014-12-09 18:37:24 UTC
From: N1CHU
Topic: 1216 Message: 1216

It's what, almost a year since the BCD536HP was introduced and first available? I have two of them... Purchased with the intent of putting the Siren App to use. But so far, I've had to satisfy myself with all the other functions of the radio. It also looks like the warranty will run out BEFORE the entire package is even delivered. But I'm sure Uniden will make good on that, something to sooth our ruffled feathers. (If I got the length of warranty time wrong, I apologize).

But regardless of what Uniden does, they can never get back the year that's past. The ghost product we all purchased and were then promised within a few months has never materialized. Somebody owes somebody something. But what?

If Uniden compensates all those who have waited, they loose some. How much can't be determined when you consider it might approach a value that would get Uniden thinking about getting out of the scanner business. Uniden has other products that probably mean more overall than the scanner division. So being fairly compensated ("fairly" being relative) might not be an option if we want Uniden to stick around.

In any event, this dissatisfied customer needs to see something from Uniden, with or without a working Siren app, to make up for the F**KIN year I've been strung along. Pardon the vulgarity but it's the most effective way I know of putting a very large explaination point on the whole sorted issue.

Happy First Birthday BCD536HP! ... and don't worry about the birth defects you suffered... we have it on good authority the surgeon is going to be able to fix you right up... Just as soon as they invent the prosthetic device!

Ok. Got that. However, there still the question of why would the scanner save all these files if I clicked on not to save. And the fact is there still there as evidenced by all the files saved under user recordings.

In the menu to review them, DELETE is an option. Perhaps the fastest way
is to connect to your PC, browse to the folder that has them, select
them all and hit DELETE.

Not a bug since they were saved before you deleted the current file.

If you don't want them, either delete them or don't use RECORD.
(or check the scanner more often)

All that said, I would like to see a "DELETE ALL" option.

Because you only clicked to not save the currently recording file.

Topic: 1216 Message: 1222

The 996 and 396 both sold for about the same $500 price when new. They had the same functionality and differed mostly in the 996 being a base/mobile scanner and the 396 being a handheld scanner. The 536 sells for $100 more than the 436 because it is supposed to have the WiFi dongle and tablet software connection. I paid extra for that, so at the very least Uniden should repay that amount. IMO Uniden has failed to deliver what the said they would. I could care less who is at fault. Uniden promised a working WiFi dongle and Siren app and never delivered. They took our money but we never saw these features in any functioning state. That is theft IMO. Had Uniden said opps we messed up and will make it right, then I would have happily let them do that. Instead they treat us like dirt, won't return our emails or calls, and sensor us on their RadioReference.com BS website. I used to really like UPMAN. I live about a mile from him. But now I think he should change his handle to UPYOURSMAN! Bottom line is that Uniden needs to make this right. They need to apologize to us. They need to either deliver the goods and/or compensate us. And quit frankly, they need to do some serious backside kissing if they eve want any more of my business.

Even though RR may censor, submit your post anyway. And any other possible email addresses that relate to Upman and Uniden. They may not list your post but they get read and counted. And the fact they are NOT posted means they were read! My take on Upman not answering inquiries is some sort of gag order from their legal department. There are people taking what legal action is available against Uniden already and more will follow... and you may not have a chance (not that you want to) to give Uniden any more scanner business if the legal action against the company causes them to drop the scanner line!

I have to agree with Scott. Great scanner. In fairness to Uniden they did advertise that the WiFi was under development from the start and would not be ready immediately. It did run longer than they had said but I think that is because they do not want you with a piece of crap. Not the end of my life that I have to wait a year and a little bit more. Now I know why Paul has no hair. I am sure he pulls out what follicles he has due to the delay. And to crap on him is downright rude because I think no one has our back more than him. I have never met the man and never received anything from him and never spoke with him but I appreciate that he listens and tells us what he can Howie Sent via the Samsung GALAXY S®4, an AT&T 4G LTE smartphone

I certainly understand your frustration and I feel some of it, too. I think this is a case of biting off more than one can chew - to use a common clique (sp?). Giving Uniden's history of great customer service and innovative products (Don't I sound like a commercial?), I think we'll see some fine results in the near future. Even without the use of the dongle, the 536HP is a great scanner! Let's just wait and see what the near future brings. I feel we will not be disappointed!! I bought my 536 last March and the only reason I bought it over the 436 ($100 less) is because I thought the WiFi feature was a great feature and would not need a hand held to carry around. It would be nice having my scanner in my shirt pocket. I really thought this feature was working until I couldn't find the Siren app and started research and found it did not work.

I still really like my 536 but I will like a he'll of a lot better if they ever finish what they started. Mean time they sold another scanner to me, a 436 which does what I wanted in the first place.

Come on Uniden, give us all the Christmas gift we all want. Not just a Dongle to hang on a Christmas tree as an ornamental decoration.

To Mr. Upman,

Thank you for the response, it wasn't I who brought it up, but merely suggested that posting on any site should be submitted regardless of if there is censorship or not. Because if a post does not get listed on the board it's because someone read it in order to make a determination. And it's just possible the essence of those deleted posts will get to who they were directed.

Answering just one point mentioned in my posts however, speaks volumes about the other points you have chosen not to reply to. That being said, I'm sure you have your reasons so duly noted on your one point. I will continue to be civil, give you the benefit of the doubt going forward. Just know this... UNIDEN owes me something. They can start by treating the people who have been loyal customers for many years by being a little more forthcoming. As for yourself, defending yourself on only one point just ain't getting it done.

There is a fine line between being forthcoming and foolish when legal action is threatened. With all the lawsuit threats and letters being sent to Uniden corporate, be thankful UPMan is able to say as much as he does. That could quickly turn into nothing should those above him decide it should.

It's not that they would be doing that to be mean - it would most likely source from legal advice from their attorneys. The biggest threat to forthcoming information are those who feel Uniden needs to be forced to do something. That seldom works out the way they intended. You cannot force technology to exist before it is ready through the court system.

I have absolutely no doubt that Uniden is not holding something back that is ready. If they are holding back, it's because it isn't ready or up to their QC standards.

1232. 536 RTC Battery

Yahoo group: BCD536HP
Date: 2014-12-12 22:37:17 UTC
From: Dewey
Topic: 1232 Message: 1232

Since we are now seeing reports of RTC (real time clock, the clock that keeps the date and time for the recordings) battery failures in the 436s, even before the scanners have reached one year since release, is there any chance that those of us with 536s will have to go through this same problem all over again... or does the 536 have a different RTC battery?

1235. P25 simulcast error issues

Yahoo group: BCD536HP
Date: 2014-12-15 16:32:05 UTC
From: dunwoodyradio@...
Topic: 1235 Message: 1235

I have recently purchased a 536 and am attempting to use it on the DeKalb County Public Safety P25 (800 MHz) trunked system outside Atlanta. This system has always presented a challenge to scanners because of simulcast issues.

I have tried to reduce the error rate (varies from 0 - 70) by using a less than optimal antenna and hopefully keeping signals from other sites from affecting reception from my closest site. This has helped, but the problem persists.

Has anyone developed a set of "tuning instructions" for P25 (phase 1) simulcast systems that I can try? Also is there any detailed information on what effect changing of the 3 "voltages" has on decoding P25 signals?

Thanks for any assistance or direction pointing.

Barry

UPMan posted updates every couple months.

That said, this will not become another Uniden trash-fest as in other forums. Not saying it has - just saying I don't want to see anyone going there.

It's not so much that it's all positive. Negative comments are fine, too, as long as they are backed up by examples or specifics. For example, saying you hate this scanner because it doesn't work is not acceptable. Saying you hate this scanner because it doesn't decode P25 well on the Okie Fanokie Swamp Regional Trunk System is fine. Obviously, the first is a flame, and that's what I will not tolerate. It also does not allow for analysis of WHY the scanner might not work.

Uniden needs to hear the negatives in order to improve things as well as the positives so they know they are on the right track.

That said, I'm pleased to say I've only banned a handful of people in the past 10 years or more. I'm talking about maybe 3 or 4 people. Out of the combined participants numbering well over 10,000, that's not bad in my opinion. Of course I would just as soon that have been 0 people, but I truly believe in each case it was necessary. There are some folks I don't personally agree with on the list. Disagreeing is fine as long as you aren't disagreeable. Agreeing with me is not a membership requirement. I don't know everything... yet. ;-> (isn't that the goal, though - to know everything you can while we are here?)

It's a problem for sure. I don't have any good answers for you.
What I have done that helps is that I have 2 sites, both programed the same. One is set to attenuated, and the other is set normal. This seems to help when mobile. In some areas the Attn will decode better while in others the non-attenuated site will be the one. In other area's neither will decode with plenty of signal.

Nope the P25 simulcast problem is not resolved in the 536, in fact I can't tell much if any difference from the 996xt.

Simulcast sites use all the exact same frequencies and you cannot attenuate one and not the other. All you'll do is make the scanner only hear one of the PROGRAMMED sites, not the PHYSICAL site. If you're equidistant from two sites in a simulcast system, the relative signal strengths are about the same. The wave-fronts will merge with each other and either add to or subtract from the amplitude depending on the precise distance in wavelengths from each tower. While moving, this causes a severe "picket fence" type of signal reception which can overwhelm the error correction code in the packets and cause dropouts. If you're stationary you'll either hear it or hear nothing depending on antenna position within a few inches one way or another (on the scanner).

Some simulcast sites use GPS to synchronize the RF frequencies - some don't. They each have their own problems and the high-end radios designed for the system have circuitry and programming to help deal with it but they're far from perfect. The scanners have much less sophisticated receivers and programming and are sometimes less tolerant of simulcast interference problems than the more expensive system radios.

The best way to deal with simulcast reception issues is to use a highly directional antenna to null out one of the sites in favor of another one.

Actually no, this is not the problem with simulcast. While most of that
does happen that is not what is causing the problems receiving P25
Simulcast.

What is actually causing the trouble is receiving the data from more
than one site simultaneously but the timing of the data is slightly
different causing the scanner to fail to decode it. It uses CQPSK LSM
which allows the receiver to demodulate more than one signal at a time
somewhat like AM. That means you don't have the cancellation like you
would with an FM discriminator.

If it was a true cancellation type situation, then the radios that
operate there wouldn't work either.

Even though it's said that the scanners are using the same decoder as
the radios, they sure don't work even close the same.

The first scanner company that builds a receiver that can pick up P25
LSM properly is going to be the winner. So far it's not Uniden or
Whistler.. Darn where's Electra when you need them?

Thanks for the suggestions. I have tried using a paper clip in place of the antenna to reduce the all but the closest site and that helped. I also have installed an 11dB gain yagi pointed at the nearest site to ensure that I get a strong signal from one site. Like the paper clip, it is about the same with some signals with 0 or nearly 0 errors and others up to 95. It is disappointing.

I was hoping to find more about what I can gain by turning off the AUTO portion of the P25 decoder and trying to manually find a value for the 3 voltages that are shown on the screen under the ERR display. I thought that perhaps this system requires some receiver “tweeking” to accurately decode the P25 traffic.

Thanks again,
Barry

Despite the lack of visible progress, we have been working to get a releasable app out. I had really hoped to have something we could shove into your stocking for the holidays, but it doesn't look like that will happen. Our estimate for release is to have a V1 iPhone/iPad app (with supporting firmware for the dongle and scanner) by the end of January. It is possible that before that time I will be able to release an open beta version for you to try at your own risk, but that is not guaranteed.

Our next focus is to complete the analysis functionality for both the BCD436HP and BCD536HP. Some work has been done on this, but it will take a bit more to have a release. We expect to release this in the March time frame. Again, we might have something to try, sooner, but, also again, no guarantees.

Following that, we'll have continuing improvements and enhancements to the app-supporting codebase in the scanner that will provide remote access capability (without using a fixed IP address on the scanner...I believe you'll be able to remotely access it in V1 if you know how to put it on a fixed IP), full menu navigation, and more (like f/w and db updates w/o having to use Sentinel).

Upon release of the V1, I will also release the protocol/API so that 3rd party developers can also work on their own apps for direct access of the scanner w/o a PC.

We finally feel like we are not being held hostage by our vendor...we have dongle firmware that appears to be stable, functional, usable...I've run out of 'ables, but seems like there should be more.

That said, we at Uniden cannot nearly apologize enough for the delays in adding this functionality. We know that it has hurt our relationship with you and has eroded your trust in us. We thank you for your patience and understanding (and, believe me, we do understand those of you who have not been quite as patient and understanding).

Please enjoy your holidays. Look forward to a great new year. UpManUpMan FAQ: http://info.uniden.com/UnidenMan4/UpMan -- Please read before emailing me directly

This is welcome news.

Will the Siren app support remote audio (via network) or just control?

I'm willing to try beta code, both app and firmware. (Since no ports appear open when attached to a network, I presume the 536 requires new firmware. Yes I scanned the ports.)

In Virtual Control under Log Options>Quick Log> make sure it is set to "Off". It's probably set to "Log and Resume".

Control and audio.
And, yes, we'll make an Android/Amazon app as well (but I've been hesitant to start burning development dollars there until I see the iPhone/iPad version does work reliably).

Subject: Re: [BCD536HP] Siren App, Analysis, and More

  This is welcome news.
Will the Siren app support remote audio (via network) or just control?
I'm willing to try beta code, both app and firmware. (Since no ports appear open when attached to a network, I presume the 536 requires new firmware. Yes I scanned the ports.)

On Dec 18, 2014, at 2:46 PM, Uniden UPMan uniden.upman@... [BCD536HP] <BCD536HP@yahoogroups.com> wrote:

  Despite the lack of visible progress, we have been working to get a releasable app out. I had really hoped to have something we could shove into your stocking for the holidays, but it doesn't look like that will happen. Our estimate for release is to have a V1 iPhone/iPad app (with supporting firmware for the dongle and scanner) by the end of January. It is possible that before that time I will be able to release an open beta version for you to try at your own risk, but that is not guaranteed.

Our next focus is to complete the analysis functionality for both the BCD436HP and BCD536HP. Some work has been done on this, but it will take a bit more to have a release. We expect to release this in the March time frame. Again, we might have something to try, sooner, but, also again, no guarantees.

Following that, we'll have continuing improvements and enhancements to the app-supporting codebase in the scanner that will provide remote access capability (without using a fixed IP address on the scanner...I believe you'll be able to remotely access it in V1 if you know how to put it on a fixed IP), full menu navigation, and more (like f/w and db updates w/o having to use Sentinel).

Upon release of the V1, I will also release the protocol/API so that 3rd party developers can also work on their own apps for direct access of the scanner w/o a PC.

We finally feel like we are not being held hostage by our vendor...we have dongle firmware that appears to be stable, functional, usable...I've run out of 'ables, but seems like there should be more.

That said, we at Uniden cannot nearly apologize enough for the delays in adding this functionality. We know that it has hurt our relationship with you and has eroded your trust in us. We thank you for your patience and understanding (and, believe me, we do understand those of you who have not been quite as patient and understanding).

Please enjoy your holidays. Look forward to a great new year. UpManUpMan FAQ: http://info.uniden.com/UnidenMan4/UpMan -- Please read before emailing me directly

So, it is supposed to beep in this instance as opposed to when it is scanning and not doing ID searching, is that what you mean?

Mind you, the scanner is scanning, only thing different this time is I told it to scan for unk id's (ID searching). Why should it beep every time it resumes scanning? Is unnecessary, IMHO.

BTW, I have the volume turned all the way down.

Hi All,

While i'm eagerly awaiting the Siren app as well, I thought I may mention a 'band-aide' solution that may be acceptable for some of you in the meantime. Before I get started, it does potentially involve spending money, and no I don't work for Butel or any mentioned software company in this write up. I also know this is not a full replacement for the siren app. If it works for you, great. If not, don't flame me for providing an option for others.

Here are my two recommendations:

- If you are looking for audio on your cellphone, do the following:

- Download the Zello app on your PC, register a free account with Zello. This will stream your audio.
- Download the Zello app on your android/iphone, register a seperate free account. This will hear the audio.
- On your PC, open Zello and sign in with the first account you created.
- Go to Tools > Create Channel. Enter a channel name.
- I would *strongly* recommend making it password protected. Remember, if you like to hear it, don't share it. Look at St. Louis...
- On your scanner, plug a 3.5mm audio cable from the audio output, to your PC's line in (or mic in, just adjust the levels so it sounds ok)
- Back in Zello, go to Tools> Options.
- Go to the Control tab on the left. Uncheck the top box (Push to talk), and Check the 'Turn on VOX for handsfree' box.
- Click on the blue link labeled 'VOX Settings'. Adjust your thresholds appropriately. Mine are -65db, -70db, 5, 300.
- In the Audio tab, choose the input (line in, mic in) that is listening the the scanner's audio output. The playback device can be set to
speakers as it's only used for incoming audio (Zello is a PTT walkie talkie
app if you haven't figured that out yet).
- The Audio tab also has your recording and playback 'amplifiers'. You can use these later to adjust the volume of the sound going to your phone.
- Click OK. This should save all your settings.
- In the main screen of Zello, you should see the channel you created earlier. Double click on it.
- On the bottom of Zello the is a large 'Zello' button, and a small button next to it with a padlock. Click the padlock button, it should turn
red. The other side turns red when transmitting audio so don't worry if

it's green right now.
- On your phone, Open up Zello and sign in with your second account.
In android, there are three 'people' and a + symbol in the upper
right hand
corner. Click on it and select 'Find a Channel' (sorry Iphone users, I
don't have one. I know the option is in there as I've provided audio to
people on iphones over zello).
- Type in your channel name and password.
- Connect (power button) to the channel and listen. Yay.
- If you need to be able to change talkgroups you could do the following
(i won't get very detailed here as I don't currently do this).
- Purchase or install a demo of ARC536PRO from butel. It allows full
virtual control of your scanner.
- Install Teamviewer on your laptop and during setup, create a
password for unattended access (this allows you to connect to
your PC from
your phone).
- Install Teamviewer on your phone. Connect to your PC by using the
PC's Teamviewer ID and unattended access password
- You can register a free Teamviewer account and add the PC's
Teamviewer ID so you don't have to remember it. Simply login to your
teamviewer account from your phone and it will show you your connected
partners.
- Using teamviewer, you could control the butel software and change
talkgroups.

I know it's not perfect, but if you select a few talkgroups ahead of time
you wouldn't need teamviewer/butel.

Any questions let me know.

1264. NEWBIE HERE Oviedo Florida Seminole CO TRS

Yahoo group: BCD536HP
Date: 2014-12-20 01:50:59 UTC
From: rhyolite@...
Topic: 1264 Message: 1264

I am in the market for a new 536HP. For past few months my analog monitoring of the Seminole County system has been thwarted by their decision to convert to P25.

1) Are there any other users that are monitoring this system who could compare notes?

21) Are the Oviedo PD dispatches encrypted?

3) What is the experience with simulcast performance of the 536HP and the Seminole County system? I expect the system is LSM and Phase 2 upgradeble, this my interest in the 536HP.

Where I live there is some distortion on the analog system, thus my concern.

4) Any reasons I should not invest in the 536HP? This is my first trunked "scanner", my previous TRS scanning were with Motorola SPECTRA subscribers (I am a "radio wrench").

Thanks for the interesting info about what makes P25 different than a normal FM Simulcast system, like a paging system for example.

I understand that there is a site identifier as part of the P25 protocol. If that is true, is it possible to program the Uniden BCD536HP to look at only THAT site ID when scanning talk group IDs? That way the radio would ignore the other sites in the system.

BTW - I have the receiver working on a 12B yagi pointed to the nearest site but I am still seeing erratic high error rate events.

Thanks again for the earlier info.

Barry

While I see what you are trying to do with the beam, it's still possible that you're giving the radio TOO MUCH signal, overdriving the front end. 12db is a significant amount of gain and even the beam directionality won't guarantee not hearing the other site(s).

I'd consider giving it the LEAST amount of signal (attenuate, collapsed antenna or a 'rubber duck' antenna) to give a stable decode.

If each site has a unique identifier, it should be possible to listen to only one site. If they share an ID...

Rick, WA6NHC

It was indicated that the 536HP had made improvements in the reception & decoding. But at least in my field testing that has not proven out. It seems to be decoding accurately on the same level as a 996XT. The 536 will stop working in the same overlap areas that thwart the 996XT they will pretty much defeat a PSR500 as well.

The one major advantage of the PSR500 is that I can put it into the analyze mode and it will give a live error rate off the control channel that I can use to optimize the antenna for reception. In fact when I set up a fixed location for a 996xt I'll use the PSR500 to get the antenna set up, and then plug it into the 996.

No it can't only look at the one site. Since the signal is simulcast it's the same data on the same frequency coming in from multiple locations, with slightly different timings. Once it hits the antenna the received RF is just that, the received signal, there's no separating it once it's in the receiver.

What you can do that may help greatly is look at your signal level, and add an attenuator to the coax to reduce the signal level. 2-3 bars seems to be a good level.

It sounds like you are not experiencing poor decode, but perhaps
overload. That is an issue no decoding algorithm will be able to solve.

For the error rate, press FUNC then VOLUME.
It will show on the top left.

Joe, I don't think you quite understand what causes the timing issue.

It's not overload at all. I'm not saying that you can't have an overload condition, but in most of the cases I've worked with it's strictly decode failure, plenty of signal but not too much. I don't know if I can easily explain it but let me try to explain it this way. What is happening when you have multiple sites transmitting the same data stream on the same frequency at the same time you will receive and demodulate (this happens before the decoder) the data stream from all sites that are in range of the antenna. Now here comes the problem, if you are different distances from the transmitter sites, the signals will arrive with nano seconds of difference in time. That time difference causes the individual bits of data to not line up exactly. The real radios do a much better job error correcting and sending the proper bits to the decoder.

Since the scanner can't do the error correction properly, you are pretty much limited to correcting it with the received signal. By attenuating the signal you may reduce or remove one of the distant sites from the received signal enough that it is no longer adding to the errors. The Yagi mentioned earlier, can also be used effectively, but it may also be picking up a even more distant signal that is behind the close signal due to the gain of the antenna. That's why I indicated an attenuator may be of assistance. If you knock the close signal down to 3 bars or so, you might knock the distant one down enough to be out of the picture.

I think to some extent too many distant signals even effects the pro radios. If you look at a new Motorola install you'll see that none of the fleet will have gain antennas. They all have simple 1/4 wave whips, which is only about 1 inch stub sticking up.

> For the error rate, press FUNC then VOLUME.
> It will show on the top left.

Yes, if a talk group is active, and stays active long enough for you to do anything about it. I tried to get it to show on a control channel but I can't even manually dial up a control channel on the 536. That could just be frustrated operator error. But the scanner is so dumbded down, and it's not very intuitive, it typically has me ready to toss it out the window once or twice a day.

I'm not sure you understand what overload is. It's not having too much
on-frequency signal - it's having too much off-frequency signal such as
Cellular that interferes with the scanner's ability to get a clean signal.

Yes, I understand what simulcast distortion is.

One 'trick' of a yagi is not to focus it on a tower you want, but to
adjust it so the one you don't want is in the null of the pattern.

> I think to some extent too many distant signals even effects the pro

Not true in my area. All the installs use gain antennas on the simulcast P25 system. And have few simulcast distortion issues. Same for the Uniden scanners, too. But, it is set up fairly well. The only places I see any issues are near cell sites. Again, this is due to overload of the receiver, not simulcast distortion.

Joe M.

1273. MASS STORAGE mode vs. SERIAL PORT mode.

Yahoo group: BCD536HP
Date: 2014-12-23 03:29:52 UTC
From: Ed (K9EDK)
Topic: 1273 Message: 1273

I have a really simple question, and I already think I know the answer, but I'll ask it anyhow. I looked through the old messages and the manual, and didn't see much about this topic at all, so here goes.

Is there a way on either the 436 or the 536 to get from Mass Storage mode to Serial Port mode without unplugging the cable or turning the radio off and then back on? I typically leave the USB cable plugged in all the time. Should I be unplugging the cable, which would make my question a moot subject?

Ed

I know these messages are semi-anonymous, but just to give away a bit, I've been doing two-way service, 800meg system debugging, custom solutions, as well as broadcast engineering for a bit over 35 years. With that I think (at least I hope I do) I understand front end overload as well as quite a few other things that happens to receivers in high RF fields.

Of course that doesn't mean I'm always correct, that I didn't misread a post and jump to a totally irrelevant conclusion, it just means that I hope I'm a bit better versed than the average scanner listener.

Of course Joe, often when I reply to you it's more to provide information to the forum in general. I don't know your background but you seem to have a pretty good grasp on things as well. So don't ever take any offense at my posts. hehe If I ever decide I have something offensive to say that message will come private. :)

OK. What "threw" me or misled me is your statement of "plenty of signal but not too much". That's why I said what I did. I wanted to make sure you knew that overload was not due to "too much signal" which I admittedly took to mean too much on-frequency signal. An on-frequency signal can really never be too strong to cause issues (until your front end starts smoking, that is). :-)

I have read posts (here and elsewhere) where someone things overload is caused by too strong of an on-frequency signal.

We've got similar experience with the exception I'm pretty weak on broadcast experience. Most of my experience in that field was in the 80s with video shooting and editing. I never cared for the RF that could take fingers off if you pointed in the wrong place. I have parrots that are good for that task these days. (not that any have)

Mass Storage is used for Sentinel (or Windows Explorer) to write the SD
card. Serial mode is used to power the 436 (N/A to 536) or to output
serial data to programs such as Unitrunker.

From: vwjettapilot03@...
Topic: 1264 Message: 1282

Just saw your post and took an interest as my parents and my sister are now living in Oviedo.

Browsing the RR DB, I see Seminole County as a APCO P25 CAI system, just like what I have down here in Miami for the county PD.

None of the Oviedo talk groups show as being encrypted. Just remember, when you get your radio, thoroughly familiarize yourself with its programming software: Sentinel.

Make sure you enable in your profile, all service types so that you may not miss anything you want to monitor.

I have read a lot about simulcast issues, but I get the sense that, depending on your location, this may, or not, be an issue. Seeing this post now, since your original posting date, and no replies, leads me to believe you will be the guinea pig for it.

If you are getting the 536HP, do yourself a favor and use an external antenna with it.

I have both the 436 and the 536, I use the 536HP with an external antenna and it is excellent. The 436HP i use in my car and even switching back and forth between a Radio Shack 800Mhz rubber ducky antenna and a magnetic mount antenna on the car, reception of my favorite P25 system is iffy. Funny thing is I can't really blame the radio, I hook it up to my external antenna at home and get as great reception as I do with the 536. This is only a problem with P25 systems, as all other trunked systems, come in with no problems.

I see Oviedo on RR and you should be able to receive it ok. I don't see any of their channels as encrypted. However, this doesn't mean that they actually are. Remember that, RR's DB, is compiled thanks to listeners like us, who do the grunt work and actually sit down, monitor, take notes and submit changes to the data base.

In regards to your questions, can't answer none of them except of #4.

In researching these radios prior to my purchases (I ended up getting the HP1 and both x36HP's), YMMV. Some people swear by them and some claim their GRE PSR800 / WS1080, are better reception and decoding of P25 systems wise.

Myself, I'm willing to try out the GRE / Whistler products only because monitoring my favorite P25 system down here in Miami has been greatly unsatisfactory, with the 436HP. This might be due to antenna, location (being mobile) or other factors I am not familiar with. When I connect my 436HP to my external roof antenna, it works as well as the 536HP, so, I believe, and would like to try, the GRE/Whistler products.

Topic: 1264 Message: 1285

Having lived in Coconut Grove in the 80's and 90's and having been involved with the testing of MDPD EDACS simulcast system of the time, I am well aware of the difficulty of countywide simulcast in that system. One would hope the linear modulation of the Harris P25 would be an improvement.

I am hoping not to be a guinea pig as to reception of the Oviedo TG's. I would feel silly spending $500 to find out that the TG is encrypted. In past I have used a SPECTRA radio to monitor the analog system. Of course, that ended this summer with the switch.

1286. Re: P25 simulcast error issues

Yahoo group: BCD536HP
Date: 2014-12-26 02:04:53 UTC
From: rhyolite@...
Topic: 1235 Message: 1286

The modulation used for linear simulcast is susceptible to distortion caused by the power amplifier (thus the requirement for a linear PA. A non-linearity affects the phase stability and thus the ability for a demodulator to track the phase modulation.

It is not improbable that an excessive receive signal (on channel) might create overload (and non-linearity) of the receiver LNA.

Point to point microwave links which use modulation of this type, sometimes require the power to be backed off in order to reduce bit error rate (BER).

So if you are using a Yagi gain antenna to discriminate between simulcast sites, and have a strong receive signal and still experience high BER, try some attenuation.

And similarly, if the receiver is being overloaded from an off channel or out of band signal (cell site etc,) you might need a bandpass filter to reduce that offending signal. Out of band or off channel signals likewise can overload the LNA.

It is good receiver design to limit the bandwidth that the receiver LNA is subjected to, unfortunate scanning receivers don't have the design freedom to implement an effective inexpensive BP filter.

"An on-frequency signal can really never be too strong to cause issues"

Just cruise on over to RadioReference.com and examine the database for your county. At the bottom will be all the trunked systems (that RR knows about) and there is an identifier for encrypted channels (E) which should tell you what you need to know before dropping $500 on a scanner.

Radioreference has volunteer administrators that are supposed to verify (or ask that the submitters verify) their information before modifying the database. The radioreference database is entirely user-submitted and depends on users like us to keep it up to date.

There is no way for radioreference to go out to a location and physically verify the information - that's your responsibility if you are submitting info. If you convince the admin that the data is good, they'll include it in the database. The best way to convince him that the data is good is to tell him you've verified it and isolated the signal to a particular talkgroup or system by hearing the conversation and deducing what it was for and what department etc. Also, on discrete conventional channels, you need to provide the latitude/longitude and radius of intended coverage for that entry.

On the subject of verifying if a scanner will receive what you are interested in... Again, I will REPEAT what I have posted before and what seems to be obvious, but for some reason I'm not getting through..

Verifying assigned frequencies and receiving equipment is as simple as talking to a local ham and/or fire department. These are possibly two of the most probable groups that would have occasion to utilize scanners. There are also state scanner groups listed on RR. Posting on your state board should get you knowledgable local help.
...and that's how you verify!

I think this might be the one I remember. I found it in a
Google search which was easier than looking through my photos.
I uploaded it to the PHOTOS section.

<<https://groups.yahoo.com/neo/groups/BCD536HP/photos/albums/1947948258>>

KA5S does sound familiar. That may have been his car. I think the reason
I remember it is due to the antennas on the hood which I'm not sure are
legal in many states.

Kinda puts my 8-antenna "porcu-Jeep" in perspective. :-)

I AM getting better - my newer car only has 6 antennas. One of those is
inside (wire running near the A-pillar), one is a not-too-often used mag
mount, and another is actually under the car. I wanted to test to see if
it would actually work, and surprisingly it does fairly well. It's a
scheme I picked up from a 3-letter agency. All my antenna numbers
include the stock FM antenna (which on my car is also internal, not
external). So, on the car you normally only see two antennas - one on
the roof (VHF quarter wave) and one on the trunk (800).

1297. Re: NEWBIE HERE Oviedo Florida Seminole CO TRS

Yahoo group: BCD536HP
Date: 2014-12-27 03:55:43 UTC
From: rhyolite@...
Topic: 1264 Message: 1297

Thanks, Bob; Yes I have been posting this question on Radio Reference for months and apparently no-body from my area is active on RR to respond.

The real question is whether the submitter has actively confirmed no encryption on the dispatch TG's (Oviedo in particular).

I have raised questions about encryption and simulcast performance (I am in an overlap zone for the analog system) on this group as well as RR and apparently no one with answers is reading the message boards..

I am about ready to spend $500 to buy scanner and it will be a waste if encryption is in place or planned for the TG's.

I have just PM'd a half dozen folks on RR who had mentioned the digital conversion which happened in July/August. I hope to hear from all about their success and equipment.

I'm not sure where Seminole County is, but I know there are scanner email lists just for some parts of Florida. Even if ones don't exist for your area, they may be able to help you better. One thing you could do is to sit on a particular TG and see if you hear it or if the ENC icon comes on. I know this requires the scanner first, but it is one option.

Technically, UPMan (the alias) didn't exist
until he started working for Uniden. But I bet
he is now more certain than ever about the move
being the right choice given the RS rumors.

From: Bob Peloquin
Topic: 1264 Message: 1302

If there's ANY encryption, even part-time, and the admin enters E in the modulation type, it will not be downloaded to Uniden's or Whistler's copies of the master database they send to their scanners. So you won't even stop on that talkgroup or frequency - let alone decode it. This is the policy of the manufacturers and happens simply because it was an unanticipated consequence of using the modulation type field to indicate encrypted or not.

The solution is to create a copy of the system in question to a favorites list and delete all the talkgroups (or channels) - leaving the basic structure intact. Now you add the part-time encrypted talkgroup(s) or channel(s) to it using the included software (Sentinel for Uniden). Add this new favorites list to your scanning by selecting multiple favorites lists (master db and your favorites). It will now stop on those channels but audio will only be heard if it's in clear mode, not when encrypted. You won't hear any audio if it's encrypted but it will still stop on the channel.

RR needs a flag for part time encryption, but
I'm fed up arguing with them on their policies.

I dont know, i think that is a great statement toward HOA's that prohibit antennas on rooftops.

Yes, I realize that UPMan is a alias for Paul Opitz, but the comment still stands. What I was implying was that in my area Radio Shack employees are hired because they are willing to work at those low wages NOT because they have any technical knowledge. If you ask a question about an antenna with a SMA or BNC connector, you get a blank look.

Technically, UPMan (the alias) didn't exist
until he started working for Uniden. But I bet
he is now more certain than ever about the move
being the right choice given the RS rumors.

From: Dave
Topic: 1273 Message: 1307

Many years ago some of the franchise store's had people, if only
the manager, that were knowledgeable about many radio's and scanners and
parts etc. However that mostly disappeared when cell phones arrived.
Very off topic here but I did have some favorable dealings with them a
long time ago.

Small world. My 536 makes this sound when I have an external speaker plugged in. At first I thought my computer hard drive was going bad.

Back in the '80's before becoming a Police Officer, I managed for Radio Shack for several years. 60 hours a week, low pay and back then inventory by hand every two months. Nope. I don't miss it.

Just got my BCD536HP today and trying to figure it out. There are lots of things that I don't quite understand about this scanner and I am hoping that someone has some really good software that they can recommend to help me out with it.

What are you using and would you recommend it?

Thanks,
Gerald N5FWB

Sorry, I've been off the groups lately. These holidays can be heck!! I don't expect everybody to like my mobile station. I respect everybody's opinion; it would be somewhat boring if everybody just agreed and nobody felt otherwise. I sometimes promote HAM radio at shows and my car almost always gets positive responses. It doesn't "work" for everybody and a few people just don't "get it" but that's okay. For pictures of my mobile station, go to this link: https://driiive.com/Radio-Man/1985PlymouthColt/

To my knowledge, the included software, Sentinel, is the only software specifically designed for the 536HP and which includes the free RR database, essential to (relatively) easily programming the unit. Other software, like BuTel and ProScan are probably better but they lack the free integration with RR. I have used BuTel with other scanners over the years and find it to be much better than Sentinel but, in my opinion, the RR inclusion makes Sentinel the way to go. Even at that, be sure to buy a jumbo bottle of aspirin - you'll need it!

Besides reading the manual, go to YouTube and and search for user K4DPS.
Doug has put together some great videos. He has several for the 536HP.
I learned pretty much all from him:)

1318. RTC Battery failure

Yahoo group: BCD536HP
Date: 2014-12-28 18:34:58 UTC
From: cjvail13@...
Topic: 1318 Message: 1318

I tried searching this forum and could not find the answer I was looking for. If i missed it I do apologize. My problem is that my RTC battery no longer holds a charge. I have left it on for over a week on 2 occasions to attempt to charge the battery and both times after turning the scanner back on it prompts me for the date and time. My question is am I able to replace the battery myself? If so how do I go about doing so? Or am I better off sending it back to Uniden to get it replaced?

Chris

Arc has an exclusive deal with Uniden to have software for the HP series radios and you can also download from the RR database using ARC Patrol software.

This “problem” is starting to crop up on the 436s. This is the first report I’ve seen for a 536, but I did ask here a while back if the 536 was also susceptible to the RTC battery failure. I can’t answer your question on what to do, but I can say that the door-to-door turnaround time for my 436 was ~3 weeks when I sent mine in. It’s a true SHAME that this may be a yearly problem we are going to have with these flagship scanners and Uniden is so quiet on the problem!

Date: 2014-12-29 01:30:29 UTC
From: alphaacres@...
Topic: 1324 Message: 1324

Did anybody also mentioned the other "hidden feature" to monitor only unknown TGs?

Once you have enabled ID Search, you can Hold on Department and scroll to the scanner created "Unknown" department group and keep it monitoring there for TGs you don't have already programmed. Even better, it seems to search amongst all your individual programmed sites for the particular system you're in.

Thank you JETorres

I uploaded it to the PHOTOS section.

<<https://groups.yahoo.com/neo/groups/BCD536HP/photos/albums/1947948258>>

KA5S does sound familiar. That may have been his car. I think the reason
I remember it is due to the antennas on the hood which I'm not sure are
legal in many states.

Kinda puts my 8-antenna "porcu-Jeep" in perspective. :-)

I AM getting better - my newer car only has 6 antennas. One of those is
inside (wire running near the A-pillar), one is a not-too-often used mag
mount, and another is actually under the car. I wanted to test to see if
it would actually work, and surprisingly it does fairly well. It's a
scheme I picked up from a 3-letter agency. All my antenna numbers
include the stock FM antenna (which on my car is also internal, not
external). So, on the car you normally only see two antennas - one on

the roof (VHF quarter wave) and one on the trunk (800).

Subject: Re: [BCD536HP] What software are you using?

Arc has an exclusive deal with Uniden to have software for the HP series radios and you can also download from the RR database using ARC Patrol software.

Dave M.

On 12/28/2014 00:21, kc0sbl kc0sbl@... [BCD536HP] wrote:

To my knowledge, the included software, Sentinel, is the only software specifically designed for the 536HP and which includes the free RR database, essential to (relatively) easily programming the unit. Other software, like BuTel and ProScan are probably better but they lack the free integration with RR. I have used BuTel with other scanners over the years and find it to be much better than Sentinel but, in my opinion, the RR inclusion makes Sentinel the way to go. Even at that, be sure to buy a jumbo bottle of aspirin - you'll need it!

Just got my BCD536HP today and trying to figure it out. There are lots of things that I don't quite understand about this scanner and I am hoping that someone has some really good software that they can recommend to help me out with it.

What are you using and would you recommend it?

Thanks,

1328. A different approach

Yahoo group: BCD536HP
Date: 2014-12-30 20:37:34 UTC
From: kenstark@bellsouth.net
Topic: 1328 Message: 1328

UPman,

We all have been living
with the APCO-P25 Simulcast decoding problems now for a number of years. Starting way back with the Uniden BC250D and the BC785D both with the optional digital card. Then the BC296D and BC796D with the digital card built-in.

Eventually we moved onto
the Uniden BCD396T and the BCD996T and even with firmware updates the problem persisted. These models eventually were replaced with the BCD396XT and BCD996XT and again with firmware updates the problem remained. Now with
the newer HP-1 and HP-2 and the BCD346HP and BCD436HP we are still having the same problem.

Not only does the same APCO-P25 Simulcast decoding problem still persist, it is actually now a bigger user issue, as more APCO-P25 systems come-on-line replacing the older analog systems. Which means more scanner users are getting frustrated over the poor digital decode then before!

By now we all have read about and have an understanding of all the
reasons for this problem. Including the price difference between scanners and the system users
actual (Motorola) radios.

What I would like to propose, is that radio manufacturers like Uniden, take
a different approach to solving this problem. Designing a scanning radio just for Public Safety APCO-25 Radio
System monitoring. Do not include in these radios the abilities needed for all the legacy stuff. Including eliminating the ability to receive frequencies not being used for PS APCO-25 Radio System. Get ride of all the
older trunking capabilities, get ride of the weather bands, get ride of the aircraft bands, get ride of the Amateur Bands, and so on. It's like having two pounds of junk in a one pound bag and the bag is tearing from all this weight.

I would like to see a separate family
of scanning radios that are dedicated only for monitoring APCO-P25 P-I and P-II non-trunking and trunking radios systems. Designed from the ground up with the required receiver hardware and firmware/software
to take into account the simulcast problem comparable to the way the user's radio take care of the problem on these
systems. This should include error correction capabilities, and any other technologies that might improve on this problem, including a way for the end user to adjust for the simulcast timing problems.

The first digital television tunners, had a similar problem of pix-elation and drop-outs do to ghosting. Multiples of the same single arriving at the tv's digital tuner at slightly different time. Eventually that has been reduced to almost not being a problem by better hardware and firmware in the TV itself.

As a licensed Amateur Radio Operator, I am amazed at the new digital amateur radios, both repeaters and ht. Especially the ones that are P25 Capable and are being used in a simulcast/multicast repeater network. This indicates to me that a reasonably priced, usable P25 capable Trunk-tracking radio with the proper hardware and firmware/software is possible in the high-end of the consumer scanner market.

Thanks.....and Keep Safe!

I have used Uniden 396T, 996T, Home Patrol 1, BCD436 and Home Patrol 2 for monitoring P25 systems in Minnesota. They all work great, no simulcast issues for me. Could it be problems with your system or your location?

Same here. P25 simulcast and few issues. I've also heard of cases where scanners were an issue, but so were the subscriber radios. So there is no guarantee that such a new scanner would work any better aside from perhaps due to the improved filtering and what not. But, you would also be spending a grand on such a scanner and really is the market going to support the development costs? It's risky.

I bet many stations would use technology of this type in lieu of a radio as a station monitor!

Not to rain on Uniden... well maybe... but I do wish they would fix their scanners' inability to properly receive patched talkgroups.
Another PROBLEM that has been around for many years! For those who are not aware, this is where the scanner will only receive on one talkgroup when two or more have been patched together, such as, midnight and holiday staff reductions when some of the larger departments will patch two or more primary/dispatch channels since the slower pace is easily handled by a single dispatcher.

Dewey

Ken,

I have always wondered why companies like Icom, Yaesu and Kenwood
never ventured into Trunk Tracking in their products. Any ideas why not?

Could be Minnesota isn't Simulcast, to be simulcast the towers need to
be only about 8 miles apart. They don't have that many towers on the
state system. At least not when I was up there working on it.

Where did you get that from? Simulcast can be any distance apart.

It's just that the farther apart the towers, the less overlap you have (hence lowered interference possibilities), but that doesn't happen until about 30 miles apart or greater. And then you have coverage gaps.

But, as I recall Minnesota is a P25 Simulcast system.

Not all sites in Minnesota are simulcast. More heavily populated areas are. My scanners work well in all areas of the State.

Analog simulcast is different from digital simulcast, and in digital simulcast the tower to tower spacing is a factor.

In P25 digital simulcast we are dealing with an unmodulated RF carrier that shifts to specific frequency offsets from the center of the assigned channel. These frequency shifts are detected in the receiver and decoded as a digital waveform which is then converted to an analog waveform in the user radio. Unlike analog simulcast where the audio is delayed at the individual transmitters in order to achieve minimum phase distortion in a target area; digital simulcast signals are in phase when transmitted. Limiting the distance between tower sites limits the timing errors at the receiver location.

IIRC Phase 1 systems can be up to 15 miles apart while Phase 2 systems require closer tower to tower spacing.

Spend some time looking at the published specs for P25 for more information.

There are those who believe that the underlying architecture of the Uniden, and GRE/Whistler, scanners needs to be changed. It's my understanding that the scanner manufacturers are still using traditional FM detection methods and then decoding the data from the detected signal. There's a school of thought that an I/Q signal processing method, such as used by most of the SDR receivers, would yield better results. You can buy SDR dongles pretty cheap these days.

There are no P25-capable radios being produced for the amateur radio market. If you are thinking of Yaesu System Fusion, it is not P25.

There will be combined ham/commerical market P25 HTs in the next month
or two. They will also do D-STAR, DMR, NXDN, and of course analog.

They won't be able to do proprietary modes such as Connect Plus or
Capacity Plus MotoTRBO.

The Minnesota definitely is Simulcast - even the RR database identifies the sites as Hennepin County East Simulcast etc. RR has 28 Simulcast sites so named in Minnesota.

Kenwood defines the markets they want to be in.

- LMR - Full product line

Kenwood NXDN (NEXEDGE)

NX-5200/5300/5400 P25

A key element of the NXDN™ air interface is the AMBE+2™ vocoder which digitizes speech while retaining natural voice nuances, performs noise reduction. The radio's digital signal processor (DSP) protocol- packages the vocoder, signaling, control, NXDN™ is a Frequency Division Multiple Access (FDMA) methodology whereby one user accesses a channel frequency at any one point in time (i.e. accesses via the frequency domain). Other digital methods such as Time Division Multiple Access (TDMA) permit more than one user to access the channel frequency via timeslots (i.e. accesses via the time domain), but there has to be a tradeoff between coverage and effective transmission rate, as increasing the former means decreasing the latter.
Digital Modes
1, Digital Conventional
2. Digital Conventional IP Networks
3. Digital Trunking
4. Digital Trunking IP Networks

- Amateur Radio - Full product line including DSTAR

Icom defines the markets they want to be in.
- LMR - Full product line - P25 Radios 9021B/S/T

- Amateur Radio - Full product line including DSTAR
- Marine
- Avionics

Vertex/Yaesu defines the markets they want to be in.
- LMR (Vertex) On pricing take a look at the Vertex Standard VXD-720 Transmit/Receive. Though it is not a trunk capable radio is does contain an AMBE+2™ Digital vocoder and it retails for $567.00
- Amateur Radio (Yaesu) - FT1DR the dawn of a New Digital Communications ERA

Thanks.....and Keep Safe!

How is that Multiple Access?

That's the nice thing about FDMA. Everyone has their own definition of it. No Division needed. No Multiple Access needed. I'm surprised they still use Frequencies. ;->

On the subject of price:

Look at the CS700 UHF radio Tx/Rx from Connect Systems Inc.

Compatible with Motorola and Hytera DMR Radios
For under $300

I stand-by my original idea - A dedicated P25 Uniden conventional/trunk-tracking scanner!
with improved simulcast capability better digital audio quality then in present scanners

I would add, the possibility of a firmware option/choice for the present Uniden P25 PII capable scanners.
Choice 1 - Present firmware - does everything
Choice 2 - Firmware with dedicated improved P25 capabilities

Thanks.......and Keep Safe!

Is the 536 using an I/Q Demodulator? If not, then the receiver is limited in the ability to enhance and refine the demodulation code.

The seperation of towers affects not only signal strength and capture, it affects the phase delay arriving from two or more sites at a receiver. Thr design of a simulcast system is about 80% science and 20% art. You have to make sure the signal modulation envelope is idential between sites, that the timing is such that digital bit stream is not significantly corrupted. The 80% part is system design and rough site selection, the rest is fine tuning a computer model to use best antenna selections.

It is not trivial. TSB88C is a good start toward understanding some of the parameters of the 20% part.

Ken,

I've been contemplating buying a new scanner, reading about issues associated with the various models. As I've been reading I too have been wondering/thinking when a company like CSI will enter this market.

As you point out they've developed an amazing little low cost DMR radio that has really opened the floodgates for DMR's growth in the amateur radio ranks. Seems to me that they could do something similar in the scanner market.

Curt

Curt,

Digital is hear to stay!

Though I would like to see Uniden, be the first with a Digital Only Scanner, if CSI or someone else comes out with one that overcomes today's short comings I will be one of the first to own at least one.

Taking the simulcasting situation out of the picture and just comparing how the low cost CSI DMR audio sounds, one realizes that much better digital audio is possible for a reasonable cost then the digital audio of today's more expensive scanners.

Our repeater group here in Raleigh NC has been experimenting with the new Yaseu digital repeaters (I believe they are rated for 50Watts Tx output), and the Yaseu digital HTs (rated at 5Watts TX output) with great Digital Rx audio .

One of the many features of this digital repeater is its ability to multicast what it receives in the digital domain out into the analog domain at the same time. It also handles the reverse direction, allowing for full interoperability between the two domains. All this and more in this repeater at a cost justifiable price of $1,500!

I can be talking on my analog HT through this repeater to my friends while they are using their HT in the digital domain. I can tell they are digital even though I am analog because their voices sound like they are being sampled. But their voices are loud and clear, and I am driving in my car or walking around in my neighborhood without any noticeable signal and audio degradation.

Thanks.......and Keep Safe!

Ken StarkW4KJS/ WQCB806/ WPC4KJS/ KNC4GS

Hmmm, no. And contrary to another poster, there are distance limits on both analog and digital. Digital is pickier than analog about the distance. I've been running trunking systems for a living for about 20 years. The first made extensive use of simulcast in analog only on 900 MHz. For the last almost 11 years I have run a public safety mixed mode Motorola analog and digital system that is mid-process of converting to P-25 standard. In both cases, Motorola will give a spec on max distance for simulcast sites. When you get outside that range, the effects are different between analog and digital (and narrow vs wide digital), but both are affected by having the simulcast too far apart.

What is even more important is that a simulcast system be setup and maintained correctly. Some really minor errors in launch time or frequency and it REALLY goes to hell in a handbasket in a hurry.

From: bob.peloquin@...
Topic: 1328 Message: 1356

I think there is some confusion about what constitutes "simulcast". I've heard it used two ways:

1) A channel is transmitted from two or more separate locations on DIFFERENT frequencies. I've heard of this when there's a lower frequency "simulcast" of a UHF system's channel for extended coverage or other reasons.

2) A channel is transmitted from two or more separate locations on the SAME frequency. This is often used to extend coverage over a wider area than a single site could cover due to terrain etc.

What we're talking about here in the scanner world is case #2. When the two or more transmitters are on the same frequency (usually synchronized via GPS or other means) then there is mutual interference from the colliding radio waves at the receiver. In analog, this causes some garbling or other distortions in conventional FM discriminators.

For digital audio modes like P-25, in addition to the time delay of wave-fronts and mutual interference canceling, the speed of light (approx. 300,000 km/sec) makes the digital pulses arrive at slightly different times so that no two simulcast sites may be separated by more than a certain number of miles to keep the pulse trains in sync between multiple-received simultaneous sites.

Of course when sites are further apart such that they cannot be simultaneously received in any location (to extend coverage to another community, for example) then these simulcast reception problems are not present. But as long as you can receive the SAME frequency from multiple transmitting sites, there will be distortions to consider in system and receiver design.

Your example number 1) is actually multicast.

The confusion is the broadcast industry has used simulcast to define a program like a concert, sports event, etc being transmitted on two different media like TV and FM broadcast.

> Where did you get that from? Simulcast can be any distance apart.

As others have said not so. I might have been a bit short on the distance, (I had my mind into the mobile mode that you should be within 8 miles of a tower) it is somewhat frequency dependent. This is an Excerpt from a consultant written document in reference to Cass Co Minnesota.

"Simulcast systems also may require more tower sites than other system options, as there is a critical engineering factor affecting the line-of-sight distance between the sites. Simulcast transmitter sites may be no more than 7 miles (VHF) to 18 miles (800 Mhz) between tower sites due to potential problems with the overlap zones."

The rest of the document is here-->
http://www.co.cass.mn.us/sheriff/pdfs/Section3.pdf

Mind you they were pouring it (The Bravo Sierra) on quite thick. That's how you get a $40 million radio system when a 1M system would have worked absolutely perfectly. Guess I shouldn't say much, I was actually in Minnesota doing surveys of the existing systems. Trust me many of those systems that had been serving the needs for many years, probably cost less than $100K. For another $200K they could have been made to do everything needed of them for the next 20 years. But that wouldn't stuff enough money in the right pockets. Humm Interesting reading, Cass was one of the counties I surveyed I even stopped by and said hello to Paul & Babe next door in Bemidji.

Yup. Multicast is the technical term but we're talking about scanner-users, not broadcast engineers. It's common (as you say) to call multicast 'simulcast' just as you said so many people associate it with what we're talking about (true simulcast).

Update the full database first. Check to see if the problem goes away. If not, I'd eliminate the new Favorites file from your SD card. Check again for improvement. If still no luck format the SD card and start adding your FL's one at a time, checking between each addition for proper operation.

From what you wrote (and there is really not enough to go on to make a definitive stab at the problem's cause) I ignore exploring what exactly caused it and attempt corrective actions, trying to go through them systematically, reversing in order the last action, then the next, etc. I found that understanding the problem can be more time consuming than removing the last file that was installed or the last command that was initiated.

Maybe the favorites file you mention has malware, or some coding that is what somebody thinks is funny when it infects others.

If the scanner sees corrupt data, it could cause an error in the CPU
that causes a reset. So, while the FL isn't controlling the scanner,
it can cause erratic operation.

Sentinel read from scanner takes a few seconds, versus a number of seconds on the previous computer. When I try to write to the scanner, I can't. It's like there is no favorites list database within Sentinel on the new computer.

From: s.w.smith@...
Topic: 1232 Message: 1368

I guess no one else here has had a problem with the RTC battery in the 536? My 536 is still under warranty so I'll contact Uniden before I open the unit to see if this battery is user replaceable or not. I'll report what I find out here. Perhaps I'm the first one to have this problem with the 536 but I'm sure I won't be the last.

Did you try the Update HPDB link in Sentinal? Try that then the Read From Scanner tab and see what you have.

Sentinel read from scanner takes a few seconds, versus a number of seconds on the previous computer. When I try to write to the scanner, I can't. It's like there is no favorites list database within Sentinel on the new computer.

Hi All I would like to know when i can purchase a BCD536HP with out any issues and have to return it to
Uniden. Maybe UPman could shed some light on this question. From what i have been reading out
here and 1 year later the scanner still has a few bugs. I can't afford a 500 dollar scanner and to have it fail after 3 to 6 months..
So I'll wait until I read from you people that it is OK to buy one that really works well

OR wait until the next model that comes out with NO issues

Ron

Hi I have had both. BCD536HP and BCD436HP for almost a year with no issues other than what we are waiting on in firmware upgrades. The Siren app ability on the 536, the analyze function on both and a few other goodies to come.

Look at all the recalls on automobiles and problems. I have 5 Uniden scanners without problems, lucky maybe but Uniden will make it right if not.

Other than a few issues with learning how the radio works, and how to program it, I haven’t had any problems at all. Thanks to a Christmas sale, I bought a second 536 and I now own two of them, and a 436. Both of my 996’s are now on eBay.

1378. Re: [BCD536HP] Re: P25 simulcast error issues

Yahoo group: BCD536HP
Date: 2015-01-05 16:58:53 UTC
From: Dunwoody
Topic: 1235 Message: 1378

Hi Group:

First of all, I want to thank all who took the time to suggest various ways to resolve the high error rate issue caused by trying to receive the simulcast P25 system in my area. I have tried them all to no avail. Some transmissions arrive with an error rate of 0 - 2 and the next one will have an error rate of 70 - 90.

I tried reducing the input signal by using a paper clip for an antenna, no luck. Then I took the other approach and bought an 800 MHz yagi and pointed it at the nearest site giving me 5 bars of signal, no luck there either.

I have looked at many of the video clips on YouTube discussing this radio and P25 in general. Tried many of the things shown, still no change in reception.

I even sent a request for assistance to the customer service contact at Uniden, no response. Then I sent an email directly to Upman at Uniden and only later to find his message on Radio Reference where he states he purposely does not respond to email messages. What wonderful customer service from a company whose customers have spent upwards of $500 for a product, only to be purposely ignored.

Thus, I am returning my BCD536HP to Ham Radio Outlet and will wait for a more reliable scanner to hit the market. I am also considering getting a used P25 radio (real one) and having it programmed to match the system and talk groups of interest and calling it a day.

Again my thanks for all your support and I wish you happy scanning.

73,
Barry AKA Dunwoodyradio

Two quick questions...

Have you tried changing the mode to FM?

Also, often the purpose of the Yagi is not to point it toward the strongest site, but to null interfering sites. The only way to do this is by monitoring the system while you turn the yagi. The best direction to receive the strongest site is not always in the direction of the strongest site.

1380. Re: [BCD536HP] 536 RTC Battery

Yahoo group: BCD536HP
Date: 2015-01-05 17:18:47 UTC
From: John Stark
Topic: 1232 Message: 1380

Have you properly charged it for the required length of time? It takes much longer to charge the RTC than the scanner batteries. Two days on charge should charge it. Once charged if you let it sit too long unused it will drain the RTC as well and then you need to recharge it. If you let it sit for any length of time I'd suggest leaving it plugged in to keep the battery from draining.
And no, you can't change the RTC battery. And trying so would void your warranty.

You'll want to remember that on lists such as this you will get a wide collection of enthusiasts. From the newest babe to the crustiest GOB (Grouchy Old Bas...). You won't hear (see) many folks posting daily on how well things continue to work (thank goodness) but you WILL hear a disproportionate number of gripes, complaints and failure reports. That is the nature of email list as this.

Not everyone that owns the scanner(s) is here. Not everyone that has one gripes. But lists like this skew the numbers heavily against a purchase. Are there issues? Yes. Are they major? Generally not.

In short, the scanners work fine for the majority of folks. I wouldn't worry, it is a stable product for most folks.

Buy the scanner if you want. I have both, they work well with no issues. But I too am waiting for the day that the Siren app and wifi functions go live.

Happy New Year,
Rick wa6nhc

Howdy all,
I do not know about the technical aspects of these two pieces of equipment but I do know this 535 and 436 are working for me. I am just a scanner enthusiast who cares about how the unit performs for me. I originally purchased the 536 because I wanted to be able to hear P25 traffic and my 785D did not have the APCO card so the unit would not pick this up. I just totally appreciate the 536 so much, I went to buy a 436 so I can have a unit to take in the car which was not so cumbersome. I love both of them so far. The ONLY thing I don't like about the 436 is that you cannot charge the batteries and listen to it at the same time, maybe one day Uniden will address that issue, meanwhile, I am enjoying the heck out of it and not having to worry about the technical stuff.

One last question... Did you try the hidden menu P25 adjustments to set it to Manual on the value that decodes the best? I think that mode is in the 536...

From: Gary Saffer
Topic: 1373 Message: 1385

The only real problems with the 536 are related to the WiFi dongle and Siren. Since Siren isn't much good without the dongle, they are related.

Other people are complaining because the Analyze feature has not been implemented. That seems to be delayed due to the issues I mentioned above diverting resources.

The only real problem with the 536 was early on when some units had a problem with the headphone jack. Uniden promptly implemented a recall and repair program for the affected units.

The only other potential problem is that some units (including mine) seem to have an issue with the back light getting dim.

The rest of the problems are really just a small number of owners incessantly starting new threads on various forums about the same issues.

1386. Re: [BCD536HP] P25 simulcast error issues

Hi again:

Yup, tried that and I must say that the P25 adjustment portion of the manual lacks most of the info I found on this group. The manual adjustment, supposedly, only applies to the non-trunked systems and the one I want to hear is trunked. I don’t know what difference that makes, but there are several places where this was stressed both in the book and on various YouTube videos.

Thanks again,
Barry

The one major persistent problem is with receiving digital transmissions on my 536. Does not matter which digital broadcast I receive, happens on all 6 towns that I receive in my area, it is distorted, garbled and basey in sound. I have tried making adjustments but I see no improvement. Comparing the reception to my 10 year 2006 or 96 they both receive all the digital transmissions loud and clear and they sound like any analog broadcast. I am at a point where I guess the radio will need to be sent back to Uniden, Gil

While it isn't always 'pretty', what I do is connect the scanner to a charging port in the car and let that power the scanner (keeping the battery charged, turn the USB mode off). I then add an external mag mount antenna and a GPS input so when I travel, I always get local scanner traffic (I set the range to max so I have an early warning of traffic or weather issues, hopefully enough to detour if needed). Lastly, I take the FULL VOLUME speaker output and run that into the Aux input of the car audio system (sounds AWESOME).

That's a bunch of wires, so the real challenge is putting the scanner in a place that you can safely manage it and see it, without a bundle of wires running all over the place. In my Buick, it sits next to the shifter on the center console, wires tucked in next to the seat (except the audio line and the slim GPS line to my dash). That allows me to tap Avoid if needed (by braille method). It keeps the other occupant(s) from complaining (well it cuts it down at least). If they want to hear tunes, I can use an earpiece to listen (covering ONLY one ear or it's a citation in CA).

So if that is acceptable, charge overnight while you sleep then have the car power the radio, leaving the battery charged.

One thing I'm looking forward to is the Siren feature for the '536 so I can put it in the trailer and NOT have the space taken up in the truck cab when I travel (a tablet is much easier to manage and keeps the occupants occupied with other things).

Happy New Year!

No, it appleis to trunked as well, and as it's a 'hidden menu item', it
won't really be detailed in the manual.

My 96/2096s often 'go digital' and P25 on them has never sounded like analog. In fact, P25 on anything including Motorola and Kenwood has never sounded like analog.

This is true. Way back in 2003, I was in Philadelphia at an EMS conference. The city had recently gone to a P25 system and I had my BCD250 with me. Audio was readable, but not up to analog standards. I happened to be sitting next to an officer from PPD. He had a Motorola portable (XT3000 series) and his audio didn't sound one bit better than mine.

No doubt the state of the art has improved since then, but I'm not sure that it is yet up to analog audio standards.

What I mean Joe is by "sounding analog" is the 2096 and 96 when receiving ANY digital transmissions in CT always sounds loud and clear. When receiving the same broadcast in digital on my 536 that is NOT the case, ie distorted, garbled and basey in sound although I can usually understand the transmission it just is very unpleasant to listen too.. Some of the digital transmissions I receive are CT State Police, Bridgeport Fire, Westport Fire to name a few. I just hope I am making myself clear, thanks, Gil

There will never be the perfect radio. When a new model comes out, someone will complain why doesn't it do this or why doesn't it do that.
I've been buying Uniden / Bearcat Radios since 4 channel crystals were the latest. Had almost every top end radio amongst others.
If you are waiting for the perfect radio you will never buy one and look at how much action you will never enjoy hearing. From your local fast food drive thru window up to your local military or police department.
You have to fall back and learn to be able to leap forward. There is no such thing as perfect. The technology is always growing and improving.
Hopefully you live long enough to enjoy them. (GOB.. Don't think I am grouchy, but definitely getting old, but I like it).
Enjoy the moment or it will pass you by :)

Phil. (Not so GOB in Michigan)

I would strongly disagree that the 536 only issue is the Siren app issue.

1. It is deaf, every other radio I own picks up more.
2. The front usb port has a major issue and Unidens fix is too buy another cable and use the GPS port. The front USB port is also very flimsy.
3. The display is hard to read and the backlight is dim
4. No Line-Out either, recording to the SD card is a pain in the ass because it records everything
or nothing at all. And due to the front serial port issue to download the recordings off the SD card you have to turn off the 536, then change cables, then figure out the different
USB port number. You also have to do this every time you want to update frequencies or make changes to the radio if you use software.
5. The audio on P25 goes from too low to ear splitting loud.

I really don't care about the Siren app, I use Teamviewer to log into my radio PC and control
and monitor. Every user has positive and negative issues with every radio. The 536 was long in
coming and expensive so people had high expectations. Depending on how you monitor will effect your view. I record a lot and network my radios so the 536 "minor issuses" are big for me. The 536 where I live is horrible on Cle GCRCN, I am about 8-10 miles from one of the sites and I barely can pick it up using a 30ft mast. My Pro-197/600 get 5 bars and 90% decode rates. On Vhf the 536 cannot hear sites my PSR500/800 can hear fine. The 536 does a pretty good job handling LSM vs the GRE radios but there also older designs. If what you monitor has a good footprint, the 536 might work fine you have to weight the good vs bad reviews I also have the 436 and like it, its a bit deaf but works where I need it. If Whistler gets the 1095 right I will dump the 536, if not I just have to hope Uniden can address the choppy audio.

I think a lot of angry owners would be less vocal if Uniden addressed the issues with yes we are working on a fix or no we can't fix it.

Barry;
If you are trying to monitor the Dekalb County system, it is my opinion that that system is pretty troublesome in the numbers of sites and great distance of simulcast site separation.

My opinion is based on experience working for Motorola when the first analog smartnet system was installed and indeed Dekalb was a guinea pig for Motorola Simulcast technology. I would assume that Motorola today has the system working adequately for Motorola subscribers which use direct I/Q demodulation.

My suggestions, before giving up on the fun, are.

1) Concentrate on audio quality not displayed BER, set the decoder tuning parameters back to factory default. Close your eyes and listen.

2) The Yagi antenna should be used to discriminate between sites, if you can point to a nearby site regardless of signal level, try it. You may need to consult FCC database for site locations. Make sure your antenna has proper cabling and connections, the antenna system itself can introduce noise, reflections and phase errors. If you have a water tank or some high rise buildings in the path or behind you, those too can cause reflections. Delays in the order of 50 microseconds or greater are of biggest concern. That equates to path reflections 9 miles or so in difference between direct and reflected.

3) Too strong a signal level may cause the front end to overload and cause phase distortion and bit error. Obtain a 10 dB attenuator and switch it in.

4) Bit errors are calculated over time, a high initial BER may reduce as good bits are received. See my suggestion #1 above.

5) Try another location to determine if the receiver is faulty or works at all.

6) The mobile environment has multipath which contributes to high BER.

7) Ask your dealer or other user for another radio or loaner to compare with yours which may indeed have a problem.

I am preparing to buy either a 996 or 536 as I have no choice in order to monitor my local agencies. My analog receiver is now useless. So I was hyped up about the 536 having improved simulcast reception. Please let us know if somehow you get it to work satisfactorily.

Regarding "legacy stuff" I agree that 10 years hence, we will never see another EDACS or SMARTNET system, but the ability to decode NB 12.5 and 25 KHz analog FM will remain a necessity for public safety mutual aid, amateur radio and GMRS monitoring.

Where the money really needs to be spent is in the "RF deck" including the IF and DEMOD. I see a lot of software designed radio (SDR) products being marketed without any regard to receiver overload, intermodulation suppression and robust demodulation performance. normally simple stuff like AGC don't perform well due to the delay in DSP signal threshold detection.

It is far sexier and sells more products to have a ton of bells and whistles. While these features are great, I too look forward to playing back digital recordings of dispatch, and loading a database using zip code, but I also expect same R&D effort to go into the radio portion.

In the old days, it was encouraging to open up the case of a MICOR or MX300 and see a huge casting providing robust out of band signal rejection. Obviously you can't use a 1.5 MHz BW tuned stage in a scanner, but today you can have an LNA with high intercept point and low noise. You do need to bias things optimally though to get the benefit, and in a handheld battery powered scanner there will be a battery life penalty.

Smoke Chaser;

I read that same report and like you puzzled by the 7 miles VHF, 18 miles 800 MHz reference. True there are several variables involved in simulcast modeling, but they don't lend themselves to blanket statements like those, only adding to confusion in the discussion.

The simulcast time differential between sites causes bit slippage (inter-symbol interference). The further apart, the greater slippage. The receiver cannot discriminate a 1 from a 0. Also, the interference ratio is power weighted, thus having three site overlap is worse than two sites. Mitigating this; is signal capture ratio, use of directional antennas, using terrain blockage to an advantage.

As a consultant, for planning purposes I prefer to run sample coverage maps using actual or potentially usable sites. I portray the covered and uncovered areas in contrasting colors then show the simulcast artifacts in red. Even with that, the actual performance will vary due to as-built conditions. In the end, what matters is to cover 97% of the area to a circuit merit of DAQ 3.4 (see TSB-88).

Critical buildings and critical outdoor locations are handled through in building amplifiers or siting of towers.

It does amaze me the numbers of $30-100 million dollar systems. I always wonder if a proper user needs assessment is done to determine how much capacity is actually required. These systems can become overly complex and inherently difficult and expensive to maintain. There is always a design that meets current needs, is scalable and provides reasonably sufficient reliability and fallback. Sometimes the end user thinks paying more is always better. I fought these battles when users wanted a proprietary digital system long before APCO 25 became a reality, believing digital was always better than analog.

Today, in the simulcast world. P25 is the direction to go simply because the trunking standard has coalesced and it is easier to process and control digital simulcast transmission than analog. At least in theory, there is still much work to be done to simplify system architecture. Use DMR and IP Site connect for comparison, much simpler to deploy and has 2:1 TDMA inherently available. DMR can and will be simulcast in future.

> Where did you get that from? Simulcast can be any distance apart.

As others have said not so. I might have been a bit short on the
distance, (I had my mind into the mobile mode that you should be within
8 miles of a tower) it is somewhat frequency dependent. This is an
Excerpt from a consultant written document in reference to Cass Co
Minnesota.

"Simulcast systems also may require more tower sites than other system options, as there is a critical engineering factor affecting the line-of-sight distance between the sites. Simulcast transmitter sites may be no more than 7 miles (VHF) to 18 miles (800 Mhz) between tower sites due to potential problems with the overlap zones."

The rest of the document is here-->
http://www.co.cass.mn.us/sheriff/pdfs/Section3.pdf
http://www.co.cass.mn.us/sheriff/pdfs/Section3.pdf

Mind you they were pouring it (The Bravo Sierra) on quite thick. That's how you get a $40 million radio system when a 1M system would have worked absolutely perfectly. Guess I shouldn't say much, I was actually in Minnesota doing surveys of the existing systems. Trust me many of those systems that had been serving the needs for many years, probably cost less than $100K. For another $200K they could have been made to do everything needed of them for the next 20 years. But that wouldn't stuff enough money in the right pockets. Humm Interesting reading, Cass was one of the counties I surveyed I even stopped by and said hello to Paul & Babe next door in Bemidji.

I guess I'll comment on this. The Siren app probably isn't a big issue for me, but I would use it, and I'm anxiously awaiting its release. Other than that, I use my radio exclusively for real-time monitoring. I've used the available recording option, but for as seldom as I'd use it, it's not worth it. I'd love for the audio to be passed through the USB to the computer so that I don't need to run a separate audio cable.

1. I've found the 436/536 to hear far better than my old 396/996 radios, even though my old radios did a fabulous job of it.

2. I use the front USB without any problems.

3. I wouldn't say the display is hard to read, it's just different from past radios from Uniden. It takes getting used to. I have vision problems, so I can't really relate.

4. Definitely a design flaw, but if you're only monitoring, it's not really an issue.

5. I've not had any problems with audio changes on P25

One thing I'd like on the 536 is an APO feature (auto power off) where you set a time (in hours) for the radio to shut itself off. All of my Ham radios have this feature. If I forget to shut them off when I get home, they shut themselves off after the user-specified amount of time. Another thing I'd like to see is a detachable control head at NO ADDITIONAL COST. Most mobile Ham radios have be doing this for years, and I think it's a big selling feature for them. It would allow me to mount the radio anywhere in the vehicle and have the control head near the driver, taking up much less room. With all the other stuff vehicle manufacturers are stuffing into the dashboard and on the console, room for radios is becoming less and less, and mounting a heavy radio (I don't consider the 536 to be a heavy radio) on the plastic dashboards and consoles is just asking for trouble. I don't trust the plastic to be sturdy enough to support radios.

Ed

Why try to invent the wheel again? Just download the database in sentinel and select what you want and edit it the way you want. It's also easy to select what you want to hear once it's programmed in the scanner using the appropriated program buttons.

1402. Strange occurrence

Yahoo group: BCD536HP
Date: 2015-01-09 16:13:11 UTC
From: Ed (K9EDK)
Topic: 1402 Message: 1402

First of all, I searched and couldn’t find any other posts similar to this, or I just couldn’t figure out the right keywords to search for.

I was chatting with a friend the other day, standing outside my truck, the scanner running in the truck at a moderate volume. Suddenly, it seemed that the volume went to FULL and all that I was hearing was hash, like the squelch had opened up wide. I reached in the vehicle and adjusted the squelch. No change. I turned down the volume, no change. I turned the radio off, but the radio did not shut off. It was still loud noise. After another 5-10 seconds it finally shut off.

10 minutes later, it did it again, this time it may have been digital chatter from a local P25 system, but it was loud, and still sounded like the same hash, but I could notice some digital garbage down in the noise level. I tried all the same with the same results (no results) and ended up unplugging the radio from the power source.

What baffles me the most is that the power stayed on even after it was switched off.

Unfortunately, I didn’t take note of what the display on the radio said either time. I powered up the radio after the second occurrence and haven’t had a problem since, or at least not while the radio was turned on. Who knows what the radio is doing in the truck at night when I’m sleeping.

Has anyone had this experience and/or ideas about what to do about it. I’ve had the radio since just before Christmas and it was installed in my truck on Christmas eve, after a couple days on my desk being programmed. I’m suspecting I have some sort of a defect. And I’ll probably just send it to Uniden to figure out, but in the meantime, it never hurts to ask questions. Maybe Upman has some input.

Thanks,

Ed

The scanner writing the SD card before it actually shuts off is normal.
This takes about 5 seconds or so.

As for what the noise was, knowing what was shown on the display would
help greatly.

From: Ed (K9EDK)
Topic: 1402 Message: 1404

I’m not so worried about what the noise was since I was in a relatively high RF area of town, cell towers, mountain-top repeaters/transmitters, but now that all makes sense to me. Now I’m kinda embarrassed. I forgot all about the extra time that it takes to actually shut down after turning off the radio. That certainly makes sense.

THANK YOU!

Ed
